From the discovery of the fossil *Archaeopteryx* to more than 10,000 different documented species today, birds have become the second most diversified class of vertebrates on Earth. Birds have evolved extensively since they first emerged in prehistoric times--but that diversity could dwindle and even vanish unless we take steps to conserve their habitats, ensuring that they sustain their numbers and their variety. This natural history of birds starts in the distant past--going back to the Jurassic,

Cretaceous and Paleogene periods--in order to get a broader understanding of the birds that we see today. Chapters cover their lives, breeding, flight, migration and more, while also highlighting some especially unique bird fossils, such as the Pelagornis Sandersi, which had a wingspan of more than 20 feet. Also included are chapters on the loss of needed habitats, the current decline of native birds, and what can be done to reverse it.

1 Plantation forests and
biodiversity: Oxymoron or
opportunity? Forests form the
natural vegetation over much of
the Earth ' s land, and they are
critical for the survival of
innumerable organisms. The
ongoing loss of natural forests,
which in some regions may have
taken many millennia to develop, is
one of the main reasons for the
decline of biodiversity. Preventing
the further destruction of forests
and protecting species and
ecosystems within forests have
become central issues for
environmental agencies, forest
managers, and gove- ments. In this
di?cult task science has an
important role in informing policy
and management as to how to go
about this. So how do industrial
and other pl- tation forests ?t into
this? Plantation forests, comprised
of rows of planted trees that may be
destined for pulp or sawmills after
only a few years of growth, appear

to have little to c- tribute to the
conservation of biodiversity. Yet
there is more to this than meets the
eye (of the casual observer), and
there are indeed numerous
opportunities, and often untapped
potential, for biodiversity
conservation in plantation forestry.
With plantation forests expanding
at a rate of approximately three
million hectares per year, it is
crucial to understand how
plantations can make a positive
contribution to biodiversity
conservation and how the
potentially negative impacts of this
land use can be minimised. That is
the topic of this book.
