Managed Code Rootkits is the first book to cover application-level rootkits and other types of malware inside the application VM, which runs a platform-independent programming environment for processes. The book, divided into four parts, points out high-level attacks, which are developed in intermediate language. The initial part of the book offers an overview of managed code rootkits. It explores environment models of managed code and the relationship of managed code to rootkits by studying how they use application VMs. It also discusses attackers of managed code rootkits and various attack scenarios. The second part of the book covers the development

of managed code rootkits, starting with the tools used in producing managed code rootkits through their deployment. The next part focuses on countermeasures that can possibly be used against managed code rootkits, including technical solutions, prevention, detection, and response tactics. The book concludes by presenting techniques that are somehow similar to managed code rootkits, which can be used in solving problems. Named a 2011 Best Hacking and Pen Testing Book by InfoSec Reviews Introduces the reader briefly to managed code environments and rootkits in general Completely details a new type of rootkit hiding in the application level and demonstrates how a hacker can change language runtime implementation Focuses on managed code including Java, .NET, Android Dalvik and reviews malware development scanarios

Ever since the definition of the Neolithic Revolution by Vere Gordon Childe, archaeologists have been aware of the crucial importance of food for the understanding of prehistoric developments. Numerous studies have classified and described cooking ware, hearths and ovens, have studied food residues and more recently also stable isotopes in skeletal material. However, we have not yet succeeded in integrating traditional, functional perspectives on nutrition and semiotic approaches (e.g. dietary practices as an identity marker) with current research in the fields of Food Studies and Material Culture Studies. This volume brings together leading specialists in archaeobotany, economic zooarchaeology, and palaeoanthropology to discuss practices of food production and

consumption in their social dimensions from the Mesolithic to the Early Iron Age in the Balkans, a region with intermediary position between and the Aegean Sea on one side and Central Europe and the Eurasian steppe regions on the other. The prehistoric inhabitants of the Balkans were repeatedly confronted with foreign knowledge and practices of food production and consumption which they integrated and thereby transformed into their life. In a series of transdisciplinary studies, the contributors shed new light on the various social dimensions of food in a synchronous as well as diachronic perspective. Contributors present a series of case studies focused on themes of social interaction, communal food preparation and consumption, the role of feasting, and the importance and management of salt production.

"To reduce and avoid delay, American courts have developed a set of principles and techniques since the 1970s that we refer to as "caseflow management" ... The main premise of this book is that caseflow management is more than just a way to reduce or avoid delay, however. In fact, caseflow management is the conceptual heart of court management in general. We can fully understand courts as

organizations only if we understand the requirements of caseflow management. In managing a court, the chief judge and court managers should focus first on caseflow management - not just because it addresses problems of delay or backlog, but more importantly because it is the very foundation of court management in general." -- from the Introduction, p. xi.
