BMW M43 was produced from 1991
to 2002. Engine displacement
ranges from 1.6 to 2.0 L. It is an
usual straight-4 SOHC piston
engine. E36 M43 has dual-path
intake manifold unlike its
predecessor M40. The system
called Individual Control E36 Intake
Manifold by BMW and used to
provide torque across a wider rev
range. M43 was produced till 2002.

Oil pump nut. A relatively new failure mode is occurring on some six-cylinder BMW engines, like the ones used in the E36 series. The oil pump gear attaches to the engine crank by a chain and a sprocket held on with a small reverse-thread nut. There have been many recent reports of this nut coming loose and falling off the sprocket.

The engine of an automobile relies on many parts functioning properly. It should be no surprise that if one becomes deficient; it is going to cause a great deal of wear on the engine itself. The oil pump is something that is often taken for granted and should not be. Proper maintenance and care are necessary to keep this engine part performing smoothly.

But I'm not absolutely certain I have found the problem causing the low oil pressure light to come on. I've ruled out failures in the engine oil system and am convinced the oil pump is working properly, the engine oil passages are not blocked, the oil seals are not leaking, the oil pickup and screen are okay and the oil level is correct.
