The report contains the description of the MAD/I language and user's guide for MAD/I in MTS (Michigan Terminal System). The pre-defined MAD/I language, described in the report, is a procedure-oriented algebraic language designed for general-purpose use. It is styled after such languages as ALGOL 60, MAD, and PL/I. MAD/I is also intended as a convenient 'base' language for extension by a definitional facility. The language anticipates the definition (or re-definition) of: data types and structures, statements, operators and operations. The definitional facility itself is not described. The user's guide shows how to compile and run MAD/I programs in MTS. Sample runs are included. There is also a description of a compiler feature which allows assembler code for the IBM 360 to be

This book grew from a one-semester course offered for many years to a mixed audience of graduate and undergraduate students who have not had the luxury of taking a course in measure theory. The core of the book covers the basic topics of independence, conditioning, martingales, convergence in distribution, and Fourier transforms. In addition there are numerous sections treating topics traditionally thought of as more advanced, such as coupling and the KMT strong approximation, option pricing via the equivalent martingale measure, and the isoperimetric inequality

for Gaussian processes. The book is not just a presentation of mathematical theory, but is also a discussion of why that theory takes its current form. It will be a secure starting point for anyone who needs to invoke rigorous probabilistic arguments and understand what they mean.
