A pioneering revolutionary prescription for the health and long life of your pets For two decades, Dr. Martin Goldstein—America's most successful, renowned holistic veterinarian—has healed and helped his animal patients with the same natural therapies that benefit humans. The results have been so astounding that today critically sick pets are brought to him from across the country for a new chance at life and health. In this compelling, very accessible book, Dr. Goldstein explains exactly what holistic medicine is and how it works. By treating the root of a health problem instead of its symptoms, you too can help your animal to regain and maintain its own health, as nature intended. Dr. Goldstein also shares many remarkable true stories of supposedly terminally ill animals who have recovered to full wellness. Inside you'll discover • Why our animals get sick, even when we strive to give them the best of care • An exhaustive A to Z guide of pet ailments—and the best course of action • Why vaccines can do more harm than good • The link between diet and disease—and how the right diet can not only prevent disease but reverse it • How acupuncture, homeopathy, chiropractic, and other alternative options work--safely and painlessly--to restore true health • Specific guidance for the use of herbs, supplements, and natural remedies • The good news (and the bad) about cancer in animals--including extraordinary new treatments and potential cures • Coping with the inevitable death of your pet--both physically and psychologically • And much, much more Plus—the ultimate resource for holistic pet care: an extensive guide to holistic product manufacturers and stores, books, newsletters, Web sites, veterinarians, and associations!

That is what this book is about. It is a framework for planning, in which habitat is the key to managing wildlife and making forest managers accountable for their actions. This book is based on the collective knowledge of one group of resource professionals and their understanding about how wildlife relate to forest habitats. And it provides a longoverdue system for considering the impacts of changes in forest structure on all resident wildlife.

During the twenty years the authors have been associated with the field of radiation ecology, there has been a diversified and increasing use of radionuclides in applied and basic biological research. Prior to the advent of the atomic age in the 1940s the use of radionuclides as tracers was initiated, and following that period one observed a dramatically increased use in many disciplines. Concurrent with this increase there appeared many books and articles on radionuclide tech niques useful to biologists in general. Although only a few ecological applications were evident in these early years, ecologists were quick to see the opportunities available in their field. In the United States, major centers for such activities included Oak Ridge National Laboratory and the U. S. Atomic Energy Com mission's Savannah River Plant. At Oak Ridge National Laboratory Dr. Stanley I. Auerbach, director of ecological activities, encouraged with remarkable suc cess the use of tracers by his associates. Dr. Eugene P. Odum had the foresight to see that radionuclide tracers provided the means to solve many problems of interest to ecologists. Consequently, his research included some unique radio tracer applications at the Savannah River Plant. In addition he encouraged others involved in ecological activities at the Savannah River Plant to do likewise. Ecologists such as Dr. Robert C. Pendleton at the U. S. Atomic Energy Com mission's Hanford Works applied radionuclides in their research. To these early investigators and to those who followed we owe the opportunity to write this book.

Environmental Aspects of Zoonotic Diseases provides a definitive description, commentary and research needs of environmental aspects related to zoonotic diseases. There are many interrelated connections between the environment and zoonotic diseases such as: water, soil, air and agriculture. The book presents investigations of these connections, with specific reference to environmental processes such as: deforestation, floods, draughts, irrigation practices, soil transfer and their impact on bacterial, viral, fungal, and parasitological spread. Environmental aspects such as climate (tropical, sub-tropical, temperate, arid and semi-arid), developed and undeveloped countries, animal (domestic and wild) traffic animal border crossing, commercial animal trade, transportation, as well geography and weather on zoonosis, are also discussed and relevant scientific data is condensed and organized in order to give a better picture of interrelationship between the environment and current spread of zoonotic diseases. Altogether, the book presents a remarkable and a vast amount of potential

future research directions based on the link: environment-vectors-pathogens-humans. The most up-to-date source of information on this increasingly important cross-disciplinary subject, *Environmental Aspects of Zoonotic Diseases* will be invaluable for environmentalists, veterinarians, medical staff, environmental engineers, government agencies and consultants working in this field.
