Based on meditation practices Phillip Moffitt learned twenty years ago from Himalayan yoga master Sri Swami Balyogi Premvarni, this beautifully illustrated book is a guide to exploring the nature of mind and gaining a better understanding of experiences that arise during meditation. The Nine Bodies teachings map out a journey that starts with consciousness that arises in the physical body and is directly observable, and then travels through ever more subtle levels of consciousness to that which is not manifest and is only potential, and therefore has to be inferred. The book includes a series of mysterious illustrations

that Balyogi created during his time of intense Samadhi explorations. Each illustration is a rich composition of symbols that express aspects of inner experiences that are almost impossible to express with language. Moffitt makes these teachings available for meditation students from all spiritual traditions to use as gateways for exploring the nature of mind and as additional means for tracking and classifying meditative experiences. Students of yoga will also find value in the teachings of the Nine Bodies as they provide a means for contextualizing and connecting with yogic teachings on chakras, koshas, gunas, and the Three Bodies.

In a dynamic, fresh approach to weight loss, acclaimed nutritional biochemist Dr Libby Weaver discusses the nine factors that cause us to either lose or gain weight. These factors include: calories, stress hormones, sex hormones, liver function, thyroid function, gut bacteria, insulin, the nervous system and emotions. Let's face it - for many people it is not a lack of education that leads them to polish off a packet of chocolate biscuits after dinner, but their biochemistry and emotions. **Accidentally Overweight** explores the role of these two factors in fat storage and optimal wellness. **Accidentally Overweight** was born out of the 14 years Dr Libby spent at university, her strong scientific background in both nutrition and dietetics and her PhD in biochemistry. Libby has thousands of stories about how, what she calls the 'calorie equation' (how much you eat versus how much you move) is not the only determinant of our body shape and size. At the end of the day, if it was truly as simple as the calorie equation, everyone would be trim, taut and terrific and there'd be no health consequences because of excess body weight. This is not just another diet book - it is a life-changing way of understanding your body and health. **Quantum Field Theory of Many-Body Systems** Springer Corresponding to the chapters in *The Human Body in Health and Illness*, 4th Edition, by Barbara Herlihy,

The general idea that brains anticipate the future, that they engage in prediction, and that one means of doing this is through some sort of inner model that can be run off-line, has a long history. So me version of the idea was common to Aristotle, as well as to many medieval scholastics, to Leibniz and Hume, and in more recent times, to Kenneth Craik and Philip Johnson-Laird. One reason that this general idea recurs continually is that this is the kind of picture that introspection paints.

When we are engaged in tasks it seems that we form images that are predictions, or anticipations, and that these images are isomorphic to what they represent. But as much as the general idea recurs,

opposition to it also recurs. The idea has never been widely accepted, or uncontroversial among psychologists, cognitive scientists and neuroscientists. The main reason has been that science cannot be s- is?ed with metaphors and introspection. In order to gain acceptance, an idea needs to be formulated clearly enough so that it can be used to construct testable hypot- ses whose results will clearly support or cast doubt upon the hypothesis. Next, those ideasthat are formulable in one or another sort of symbolism or notation are capable of being modeled, and modeling is a huge part of cognitive neuroscience. If an idea cannot be clearly modeled, then there are limits to how widely it can be tested and accepted by a cognitive neuroscience community.
