Reliability Based Aircraft Maintenance Optimization and Applications
presents flexible and cost-effective maintenance schedules for aircraft
structures, particular in composite airframes. By applying an intelligent
rating system, and the back-propagation network (BPN) method and
FTA technique, a new approach was created to assist users in determining
inspection intervals for new aircraft structures, especially in composite
structures. This book also discusses the influence of Structure Health
Monitoring (SHM) on scheduled maintenance. An integrated logic
diagram establishes how to incorporate SHM into the current MSG-3
structural analysis that is based on four maintenance scenarios with
gradual increasing maturity levels of SHM. The inspection intervals and
the repair thresholds are adjusted according to different combinations of
SHM tasks and scheduled maintenance. This book provides a practical
means for aircraft manufacturers and operators to consider the feasibility
of SHM by examining labor work reduction, structural reliability

variation, and maintenance cost savings. Presents the first resource available on airframe maintenance optimization. Includes the most advanced methods and technologies of maintenance engineering analysis, including first application of composite structure maintenance engineering analysis integrated with SHM. Provides the latest research results of composite structure maintenance and health monitoring systems. Network Management and Maintenance IEEE Computer Society

Final Report Expert Systems in Construction and Structural Engineering Trends in economic development rely on increasing human knowledge, which stimulate the development of new, sophisticated technologies. With their utilization production is raised and the intent is to decrease natural resources consumption and protect and save our life environment as much as we can. At the same time, increasing pressure is observed both from competition and customers. The way to be competitive is by improving manufacturing and services offered to the customer. These are the major challenges of contemporary enterprises. Organizations are improving their activities and management processes. This is necessary to manage the seemingly intensifying competitive markets successfully. Enterprises apply business-optimizing solutions to meet new challenges and conditions. This way ensuring effective development for long-term competitiveness in a global environment. This is necessary for the implementation of qualitative changes in the industrial policy. "Process Control and Production Management" (MTS 2018) is a collection of research papers from an international authorship. The authors present case studies and empirical research, which illustrates the progressive trends in business process management and the drive to increase enterprise sustainability development.

The Boeing 737 is an American short- to medium-range twinjet narrow-body airliner developed and manufactured by Boeing Commercial Airplanes, a division of the Boeing Company. Originally designed as a shorter, lower-cost twin-engine airliner derived from the 707 and 727, the 737 has grown into a family of passenger models with capacities from 85 to 215 passengers, the most recent version of which, the 737 MAX, has become embroiled in a worldwide controversy. Initially envisioned in 1964, the first 737-100 made its first flight in April 1967 and entered airline service in February 1968 with Lufthansa. The 737 series went on to become one of the highest-selling commercial jetliners in history and has been in production in its core form since 1967; the 10,000th example was rolled out on 13 March 2018. There is, however, a very different side to the convoluted story of the 737's development, one that demonstrates a transition of power from a primarily engineering structure to one of accountancy, number-driven powerbase that saw corners cut, and the previous extremely high safety methodology compromised. The result was the 737 MAX. Having entered service in 2017, this model was grounded worldwide in March 2019 following two devastating crashes. In this revealing insight into the Boeing 737, the renowned aviation historian Graham M. Simons examines its design, development and service over the decades since 1967. He also explores the darker side of the 737's history, laying bare the politics, power-struggles, changes of management ideology and battles with Airbus that culminated in the 737 MAX debacle that has threatened Boeing's very survival.

Modern manufacturing systems involve many processes and operations that can be monitored and controlled at several levels of intelligence. At the highest level there is a computer that supervises the various manufacturing functions, whereas at the lowest level there are stand alone computer controlled systems of manufacturing processes and robotic cells. Until recently computer-aided manufacturing systems constituted isolated "islands" of automation, each oriented to a particular application, but present day systems offer integrated approaches to manufacturing and enterprise operations. These modern systems, known as computer-integrated manufacturing (CIM) systems, can easily meet the current performance and manufacturing competitiveness requirements under strong environmental changes. CIM systems are much of a challenge, and imply a systemic approach to the design and operation of a manufacturing enterprise. Actually, a CIM system must take into account in a unified way the following three views: the user view, the technology view, and the enterprise view. This means that CIM includes both the engineering and enterprise planning and control activities, as well as the information flow activities across all the stages of the system.

Management by Ethics (MBE) is a reformation study of the renowned paradigm, management by objectives (MBO), by Peter Drucker. This book re-focuses on how to manage companies by ethical principles with a morally developed workforce. The benefit of this ethically practical paradigm, MBE, is that all business operations function with the total moral performance of the whole workforce from board room deliberations to work-floor associations. Through the operational strategies of moral development learning offered in this book, the company becomes a team. The marketplace changes with the interpersonal caring of managers, workers, and customers enjoying the MBE spirit of a trusting caring global community.

The U.S. military's concerns about the individual combat service member's ability to avoid performance degradation, in conjunction with the need to maintain both mental and physical capabilities in highly stressful situations, have led to an interest in developing methods by which commanders can monitor the status of the combat service members in the field. This report examines appropriate biological markers, monitoring technologies currently available and in need of development, and appropriate algorithms to interpret the data obtained in order to provide information for command decisions relative to the physiological readiness of each combat service member. More specifically, this report also provides responses to questions posed by the military relative to monitoring the metabolic regulation during prolonged, exhaustive efforts, where nutrition/hydration and repair mechanisms may be mismatched to intakes and rest, or where specific metabolic derangements are present.

Dimensional metrology is an essential part of modern manufacturing technologies, but the basic theories and measurement methods are no longer sufficient for today's digitized systems. The information exchange between the software components of a dimensional metrology system not only costs a great deal of money, but also causes the entire system to lose data integrity. Information Modeling for Interoperable Dimensional Metrology analyzes interoperability issues in dimensional metrology systems and describes information modeling techniques. It discusses new approaches and data models for solving interoperability problems, as well as introducing process activities, existing and emerging data models, and the key technologies of dimensional metrology systems. Written for researchers in industry and academia, as well as advanced undergraduate and postgraduate students, this book gives both an overview and an in-

depth understanding of complete dimensional metrology systems. By covering in detail the theory and main content, techniques, and methods used in dimensional metrology systems, Information Modeling for Interoperable Dimensional Metrology enables readers to solve real-world dimensional measurement problems in modern dimensional metrology practices.
