Existing textbooks on plasma physics usually contain only a minor contribution devoted to plasma transport. The aim of "Transport Processes in Plasmas" is to provide a comprehensive and unified presentation of the transport theory in plasmas. This subject is of great importance in general statistical and plasma physics; moreover, it constitutes a keystone in the thermonuclear fusion programme as well as in astro- and geophysics. The subject is presented here by unified concepts, methods and notations. The contents are strongly embedded in a general framework of theoretical physics, appealing to modern Hamiltonian mechanics, kinetic theory, non-equilibrium thermodynamics, etc. The necessary concepts from these disciplines are briefly but completely explained, making the two volumes a self-contained text. Plasma transport theory can be characterised as a truly interdisciplinary activity, and several chapters are included containing the important concepts of these peripheral fields, briefly and completely. Many new features are introduced

in those two volumes.

Bioavailability refers to the extent to which humans and ecological receptors are exposed to contaminants in soil or sediment. The concept of bioavailability has recently piqued the interest of the hazardous waste industry as an important consideration in deciding how much waste to clean up. The rationale is that if contaminants in soil and sediment are not bioavailable, then more contaminant mass can be left in place without creating additional risk. A new NRC report notes that the potential for the consideration of bioavailability to influence decision-making is greatest where certain chemical, environmental, and regulatory factors align. The current use of bioavailability in risk assessment and hazardous waste cleanup regulations is demystified, and acceptable tools and models for bioavailability assessment are discussed and ranked according to seven criteria. Finally, the intimate link between bioavailability and bioremediation is explored. The report

concludes with suggestions for moving bioavailability forward in the regulatory arena for both soil and sediment cleanup.

Rohingyalish is the writing system of Rohingya people of Arakan State of Burma (Myanmar). Rohingya is an ethnic Muslim minority group.

The first Rohingya writing system, which used Arabic script, has been originated since 350 years ago.

They are culturally and linguistically different from other ethnic groups in Burma. Though there are two writing systems known as Arabic Script and Hanifi-

Script the latest Rohingyalish writing system has been the one which is the most easiest and widely accepted worldwide and has been accepted by ISO on 18 July 2007 awarding ISO code 639-3 rhg. The writing system was founded by Eng. Mohammed Siddique in the year 2000. It has been so intuitively designed that it takes virtually no time to learn as the writing and the reading exactly match to each other and it uses only few letters A to Z and two other Latin letters Ç (retroflex r) and Ñ (nasal sound) including five accented vowels. The first few pages include the Alphabet Table, Samples different vowels, examples of different word patterns, the language concept chart to help teachers convey the language concept followed by step by step illustration with pictures. It is suggested that the basic concept of the vowels be explained to the students before starting the actual lessons. The teacher can access many different online tutorials available to master the concept. Mac 911 Houghton Mifflin Harcourt The art of darkroom developing and printing will never go out of style.
