The mechanical engineering curriculum in most universities includes at least one elective course on

the subject of reciprocating piston engines. The majority of these courses today emphasize the application of thermodynamics to engine efficiency, performance, combustion, and emissions. There are several very good textbooks that support education in these aspects of engine development. However, in most companies engaged in engine development there are far more engineers working in the areas of design and mechanical development. University studies should include opportunities that prepare engineers desiring to work in these aspects of engine development as well. My colleagues and I have undertaken the development of a series of graduate courses in engine design and mechanical development. In doing so it becomes quickly apparent that no suitable te-

book exists in support of suchmore in-depth study. courses. This book was written in the hopes of beginning to address the need for an engineering-based introductory text in engine design and mechanical development. It is of necessity an overview. Its focus is limited to reciprocating-piston internal-combustion engines - both diesel and spa- ignition engines. Emphasis is speci?cally on automobile engines, although much of the discussion applies to larger and smaller engines as well. A further intent of this book is to provide a concise reference volume on engine design and mechanical development processes for engineers serving the engine industry. It is intended to provide basic information and most of the chapters include recent references to guide

The Change Process in Psychotherapy During Troubling Times invites readers to consider what it is psychotherapists do that leads to change. The book highlights

different theoretical approaches, questions old paradigms, and illustrates the change process when working with people facing a range of life challenges such as the survivors of childhood trauma, refugees, and people dealing with traumatic loss. Moving between consideration of micro-moments when working with individual clients and bigger questions about how to promote change in the face of current world problems, it addresses issues that touch us all. At the same time, the book acknowledges the unprecedented challenges in today's world such as the pace of change, the thousands of displaced people who seek refuge in other countries, the illness and loss caused by the coronavirus pandemic, and the impact of climate change on lifestyles and the environment. The book presents a topical consideration of the relevance of therapeutic assumptions,

theories, and practices to current global crises. With the breadth of presenting issues considered and the examples of a variety of creative approaches supporting change, the book will be useful to psychotherapists in practice and in training working in a range of settings with different populations. It will also be of interest to others working in the helping professions.

Existing textbooks on plasma physics usually contain only a minor contribution devoted to plasma transport. The aim of 'Transport Processes in Plasmas' is to provide a comprehensive and unified presentation of the transport theory in plasmas. This subject is of great importance in general statistical and plasma physics; moreover, it constitutes a keystone in the thermonuclear fusion programme as well as in astro- and geophysics. The subject is presented here by unified concepts, methods and notations. The contents are strongly embedded in a general framework of theoretical physics, appealing to modern Hamiltonian mechanics, kinetic theory, non-equilibrium thermodynamics, etc. The necessary concepts from these disciplines are briefly but completely explained, making the two volumes a self-contained text. Plasma transport theory can be

characterised as a truly interdisciplinary activity, and several chapters are included containing the important concepts of these peripheral fields, briefly and completely. Many new features are introduced in those two volumes.
