This aviation handbook is intended to provide the reader with a quick reference to identify the military aircraft flown by the Royal Canadian Air Force, the Royal Canadian

Navy and the Canadian Army during the Second World War. The handbooks in this series include a general description and a photograph from the Canadian Forces Archives of at least one of the key variants or marks of each aircraft that has been in Canadian service or used by Canadian servicemen overseas. Each

aircraft is listed alphabetically by manufacturer, number and type. General details describing the aircraft's engines, service ceiling, speed, armament or weapons load are included, along with a brief description of the Canadian or allied squadron in which Canadian aircrews used the aircraft operationally. This

is the third volume in the series. It describes fighters, bombers and patrol aircraft flown by Canadians during the war. A list of museums, private aircraft collections and other locations where survivors preserved and displayed is also included. The handbook is not a definitive list of all Canadian-

manufactured or operated aircraft, but it should serve as a quick reminder of the major examples flown on duty for anyone with an interest in Canadian military aviation.

Virtual Airplane vol. 1: Preparations

Surplus Record

The last ten years have seen explosive growth in the technology available to the collision analyst, changing the way reconstruction is practiced in fundamental ways. The greatest

technological advances for the crash reconstruction community have come in the realms of photogrammetry and digital media analysis. The widespread use of scanning technology has facilitated the implementation of powerful new tools to digitize forensic data, create 3D models and visualize and analyze crash vehicles and environments. The

introduction of unmanned aerial systems and standardization of crash data recorders to the crash reconstruction community have enhanced the ability of a crash analyst to visualize and model the components of a crash reconstruction. Because of the technological changes occurring in the industry, many SAE papers have been written to address

the validation and use of new tools for collision reconstruction. Collision Reconstruction Methodologies Volumes 1-12 bring together seminal SAE technical papers surrounding advancements in the crash reconstruction field. Topics featured in the series include:

- Night Vision Study and Photogrammetry
- Vehicle Event Data Recorders
-

Motorcycle, Heavy Vehicle, Bicycle and Pedestrian Accident Reconstruction The goal is to provide the latest technologies and methodologies being introduced into collision reconstruction - appealing to crash analysts, consultants and safety engineers alike.

The four volumes of

the "Virtual Airplane" series will teach you how to create the model shown on the cover. This guide assumes that you may know nothing about the 3D modeling software, so it starts the course from the very basics. In subsequent chapters the author builds a computer model of the P-40B fighter, gradually

introducing new methods and tools. Every step of this workflow is shown in numerous illustrations. This first volume ("Preparations") describes how to prepare and verify the reference drawings, which you need to build a 3D model.

"Preparations" also discusses various methods of checking and enhancing these

reference images. It can be useful, as a guide on its own, for all who would like to draw accurate scale plans. You can learn there how to use photos and original aircraft documentation (including manufacturer's blueprints).
