[Handbook on Firesetting in Children and Youth](#) Taylor & Francis

This outstanding textbook presents innovative interventions for youth with severe emotional and behavioral disorders. Community Treatment for Youth is designed to fill a gap between the knowledge base and clinical practice through its presentation of theory, practice parameters, training requirements, and research evidence. Featuring community-based and state-of-the-art services for youth with severe emotional and behavioral disorders and their families, this volume describes each intervention in depth, along with the supporting evidence for its utility. Most chapters present a single intervention as an alternative to institutional care. Shared characteristics of these interventions include delivery of services in the community (homes, schools, and neighborhoods) provided largely by parents and paraprofessional staff. The interventions are appropriate to use in any of the child human services sectors and have been developed in the field with real-world child and family clients. In addition, they offer a reduced cost in comparison to institutional care. Several chapters address diagnostic-specific psychosocial and psychopharmacological treatments, which are likely to be provided as adjunctive treatment in a clinical setting. Designed to update professionals in the field about effective services, Community Treatment for Youth will serve as a resource for academics, policymakers, practitioners, consumers, and researchers.

The primary challenge of delivering and evaluating family-based services lies in successfully assessing changes in families. This guide provides instruction for use of the Family Assessment Form (FAF), an instrument to help practitioners assess families at the beginning of service, develop individualized family service plans, monitor family progress, and assess outcomes for individual families. The FAF is designed as a standardized form that is adaptable for a variety of clinical, procedural, and program needs. Using a 9-point rating scale for individual items, the FAF enables practitioners to complete a psychosocial assessment of six areas of family functioning that is recorded in a quantitative manner and allows for monitoring family progress. The six areas of family functioning assessed by the FAF are: (1) living conditions; (2) financial conditions; (3) support available to caregivers; (4) interactions between caregivers and children; (5) developmental stimulation available to children; and (6) interactions between adult caregivers. The instruction guide provides a rationale for family assessment, details the development of the FAF, describes the FAF, provides information on training individuals to administer the instrument, describes the use of the FAF for program evaluation, discusses its test reliability and validity, and contains instructions for completing the FAF. A complete copy of the instrument is contained in the guide, including the "face sheet," the family functioning factors section, caregiver history and characteristics section, behavior concerns/observation checklist, and the service plan and closing summary. Treating the Juvenile Offender John Wiley & Sons

In this groundbreaking book, Charles Fishman uniquely incorporates and develops results-based accountability (RBA) into the framework of structural family therapy. Collaborating with the founder of RBA, Mark Friedman, this approach aims to transform the field of family therapy by allowing clinicians to track performance effectively and efficiently with their clients. The book begins by reviewing the historical foundations of family therapy and evaluates why challenges in the field, alternative methods, and the reliance on evidence-based medicine (EBM) have meant that family therapy may not have flourished to the extent that many of us expected. It then explores how RBA can be integrated into intensive structural therapy (IST), with chapters examining how RBA can be applied in context, such as in treating eating disorders, supervision, and how it can be used to transform the professional's clinical contexts. Relevant and practical, the book also introduces the community resource specialist to help in the treatment of socially disadvantaged families, as well as practical appendices and "tracking tools" to empower clinicians to track their data and choose treatment models that obtain best outcomes. This new approach offers transparent and measurable outcomes for both clinicians and training family therapists, lending a helping hand in making family therapy the gold standard in psychotherapy. It is essential reading for undergraduate and graduate students of family therapy, course leaders, and all clinicians in professional contexts, such as social workers, psychotherapists, and marriage, couple, and family therapists.

Test-based psychological assessment has been significantly affected by the health care revolution in the United States during the past two decades. Despite new limitations on psychological services across the board and psychological testing in particular, it continues to offer a rapid and efficient method of identifying problems, planning and monitoring a course of treatment, and assessing the outcomes of interventions. This thoroughly revised and greatly expanded third edition of a classic reference, now three volumes, constitutes an invaluable resource for practitioners who in a managed care era need to focus their testing not on the general goals of personality assessment, symptom identification, and diagnosis so often presented to them as students and trainees, but on specific questions: What course of treatment should this person receive? How is it going? Was it effective? New chapters describe new tests and models and new concerns such as ethical

aspects of outcomes assessment. Volume I reviews general issues and recommendations concerning the use of psychological testing for screening for psychological disturbances, planning and monitoring appropriate interventions, and the assessing outcomes, and offers specific guidelines for selecting instruments. It also considers more specific issues such as the analysis of group and individual patient data, the selection and implementation of outcomes instrumentation, and the ethics of gathering and using outcomes data. Volume II discusses psychological measures developed for use with younger children and adolescents that can be used for the purposes outlined in Volume I; Volume III, those developed for use with adults. Drawing on the knowledge and experience of a diverse group of leading experts--test developers, researchers, clinicians and others, the third edition of *The Use of Psychological Testing for Treatment Planning and Outcomes Assessment* provides vital assistance to all clinicians, and to their trainees and graduate students.

*Teaching and Learning in Diverse Higher Education Contexts* Bloomsbury Publishing  
Drawing on their diverse and unique perspectives, the authors examine the evolution of current principles and practices in family support and discuss future directions in quality services, training, and evaluation. They analyze the movement of family support programs into mainstream institutions such as schools, the workplace, churches, and prisons.

*The Handbook of Psychiatric Measures* offers a concise summary of key evaluations that you can easily incorporate into your daily practice. The measures will enhance the quality of patient care assisting you, both in diagnosis and assessment of outcomes. Comprising a wide range of methods available for assessing persons with mental health problems, the Handbook contains more than 275 rating methods, from the Abnormal Involuntary Movement Scale to the Zung Self-Rating Depression Scale. In this fully revised edition, more than 40 measures have been added both to the book and to the accompanying CD-ROM. The Handbook features: Thoroughly examined and revised measures that provide the most relevant and timely information for clinicians. New measures that empirically provide better patient evaluation Updated costs, translations, and contact information for each measure This handy compendium includes both diagnostic tools and measures of symptoms, function and quality of life, medication side effects, and other clinically relevant parameters. It focuses on measures that can be most readily used in either clinical practice or research. Most of the measures are designed to improve the reliability and validity of patient assessment over what might be accomplished in a standard clinical interview. The measures also demonstrate that the use of formal measures can improve the collection, synthesis, and reporting of information as compared with the use of unstructured examinations. Seventeen disorder-specific chapters, organized in DSM-IV-TR order, include measures for: Disorders of childhood and adolescence Cognitive disorders Sexual dysfunction Eating disorders Sleep disorders Aggression and much more. The discussion of each measure includes goals, description, practical issues, psychometric properties, and clinical utility, followed by references and suggested readings. This revised edition includes updated measure descriptions, new measure variants and research, and newly selected measures particularly appropriate to the domain of discussion. As a clinical tool, this book Describes how, when, and to what purpose measures are used Points out practical issues to consider in choosing a measure for clinical use Addresses limitations in the use of measures including ethnic, cultural, and socioeconomic factors that influence their interpretation Use of this special resource is further enhanced by a CD-ROM containing the full text of more than 150 of these measures -- an invaluable aid for reference and clinical decision-making.
