In single-variable calculus, we found that one of the most useful differentiation rules is the chain rule, which allows us to find the derivative of the composition of two functions. The same thing is true for multivariable calculus, but this time we have to deal with more than one form of the chain rule.

Consider a cylindrical capacitor like that shown in Fig. 24.6. Let  $d = r_b - r_a$  be the spacing between the inner and outer conductors. (a) Let the radii of the two conductors be only slightly different, so that  $d \ll r_a$ . Show that the result derived in Example 24.4

(Section 24.1) for the capacitance of a cylindrical capacitor then reduces to Eq.
