Historical Modules for the Mathematics Classroom Wiley
World-leading anthropologists and philosophers pursue the perplexing question fundamental to both disciplines: What is it to think of ourselves as human? A common theme is the open-ended and context-dependent nature of our notion of the human, one upshot of which is that perplexities over that notion can only be dealt with in a piecemeal fashion, and in relation to concrete real-life circumstances.

Philosophical anthropology, understood as the exploration of such perplexities, will thus be both recognizably philosophical in character and inextricably bound up with anthropological fieldwork. The volume is put together accordingly: Precisely by mixing ostensibly philosophical papers with papers that engage in close anthropological study of concrete issues, it is meant to reflect the vital tie between these two aspects of

the overall philosophical-anthropological enterprise. The collection will be of great interest to philosophers and anthropologists alike, and essential reading for anyone interested in the interconnections between the two disciplines.

The ninth edition continues to provide engineers with an accessible resource for learning calculus. The book includes carefully worked examples and special problem types that help improve comprehension. New applied exercises demonstrate the

usefulness of the mathematics. Additional summary tables with step-by-step details are also incorporated into the chapters to make the concepts easier to understand. The Quick Check and Focus on Concepts exercises have been updated as well. Engineers become engaged in the material because of the easy-to-read style and real-world examples.
