Validating the Use of AP® Exam Scores for College Course Placement. Research Report 2013-2 Simon and Schuster

This is the first book to show the capabilities of Microsoft Excel to teach engineering statistics effectively. It is a step-by-step exercise-driven guide for students and practitioners who need to master Excel to solve practical engineering problems. If understanding statistics isn't your strongest suit, you are not especially mathematically-inclined, or if you are wary of computers, this

is the right book for you. Excel, a widely available computer program for students and managers, is also an effective teaching and learning tool for quantitative analyses in engineering courses. Its powerful computational ability and graphical functions make learning statistics much easier than in years past. However, Excel 2013 for Engineering Statistics: A Guide to Solving Practical Problems is the first book to capitalize on these improvements by teaching students and managers how to apply Excel to statistical techniques necessary in their courses and work. Each chapter explains statistical formulas and directs the reader to use Excel commands to solve specific, easy-to-understand engineering problems. Practice problems are provided at the end of each chapter with their solutions in an Appendix. Separately, there is a full Practice Test (with answers in an Appendix) that allows readers to test what they have learned.

AP Calculus AB Lecture Notes ASCD The Advanced Placement Program (AP®) was created to provide access to

rigorous, college-level curricula to motivated and prepared high school students. This study evaluated whether the AP Exam scores from the summative exams associated with 10 courses were valid for the placement of students into higher-level college courses in the subject area of the exam. The specific AP Exams examined were: Calculus AB, Calculus BC, Biology, Chemistry, Physics C: Mechanics, Microeconomics, Macroeconomics, Psychology, U.S. Government and Politics, and U.S. History. We based this study on a sample of 53 four-year institutions with publicly available AP Exam credit and placement policies that had a total of 95,518 first-time, first-year students entering college in fall 2006. Using a multilevel propensity score-matching approach, we constructed groups of AP and non-AP students who were comparable on a number of key characteristics, including gender, racial/ethnic identity, anticipated college major, high school grade point average, PSAT/NMSQT℠ section scores, and mean AP course enrollment at students' high schools. The results showed that after matching AP and non-AP students on those important covariates, the AP students

performed as well as or better than comparable non-AP students in terms of subsequent college course grades. Tables presenting "Propensity Score Models" are appended.

Book of Proof Princeton Review
Drug overdose, driven largely by overdose related to the use of opioids, is now the leading cause of unintentional injury death in the United States. The ongoing opioid crisis lies at the intersection of two public health challenges: reducing the burden of suffering from pain and containing the rising toll of the harms that can arise from the use of opioid medications. Chronic pain and opioid use disorder both represent complex human conditions affecting millions of Americans and causing untold disability and loss of function. In the context of the growing opioid problem, the U.S. Food and Drug Administration (FDA) launched an Opioids Action Plan in early 2016. As part of this plan, the FDA asked the National Academies of Sciences, Engineering, and Medicine to convene a committee to update the state of the science on pain research, care, and education and to identify actions the FDA and others can take to respond to the opioid epidemic, with a particular focus on informing FDA's development of a formal method for incorporating individual and societal considerations into its risk-benefit framework for opioid approval and monitoring.
