Functions ...
A function of one variable is a curve drawn
in 2 dimensions; a function of two variables

is a surface drawn in 3 dimensions; a
function of three variables is a
hypersurface drawn in 4 dimensions. There
are a few techniques one can employ to try
to "picture" a graph of three variables.
One is an analogue of level curves: level
surfaces.

Section 1-5 : Functions of Several
Variables. In this section we want to go
over some of the basic ideas about functions
of more than one variable. First, remember
that graphs of functions of two variables,
 $(z = f(\{x,y\}))$ are surfaces
in three dimensional space. For example,
here is the graph of $(z = 2\{x^2\} + 2\{y^2\} -$
 $4)$.

14.7: Maxima/Minima Problems - Mathematics LibreTexts

The main purpose for determining critical points is to locate relative maxima and minima, as in single-variable calculus. When working with a function of one variable, the definition of a local extremum involves finding an interval around the critical point such that the function value is either greater than or less than all the other function values in that interval.
