In this book, experts in the field provide comprehensive descriptions of the neuroanatomy of the hypothalamic neuroendocrine systems. The book begins with an extensive discussion on the structural components of the neuroendocrine systems. The reader will be introduced to the anatomy and biology of the hypothalamus and the pituitary. The human hypothalamus is presented in particular detail using state-of-the-art imaging techniques. In the next section, the neuroanatomy of traditional hypothalamo-hypophyseal systems is highlighted, with chapters describing magnocellular neuroendocrine cells and discussing the respective types of hypothalamic neurons that regulate various pituitary hormones. Following this detailed structural and anatomical description of the neuroendocrine system, the book 's final section focuses on the hypothalamic control of neuroendocrine functions. This includes the control of circadian rhythm, metabolism and appetite via specific peptidergic circuits. This book provides essential information on the neuroanatomy and control of neuroendocrine systems, addresses

cutting-edge research questions posed by recent advances in the development of potent neuroanatomical tools, and highlights the latest technologies used in neuroendocrinology research, making it a valuable reference guide for students, trainees and established researchers alike. This is the twelfth volume in the International Neuroendocrine Federation (INF) Masterclass in Neuroendocrinology series, which aims to illustrate the highest standards and to encourage the use of the latest technologies in basic and clinical research and hopes to provide inspiration for further exploration into the exciting field of neuroendocrinology.

The Constitution Project's Task Force on Detainee Treatment is an independent, bipartisan, blue-ribbon panel charged with examining the federal government's policies and actions related to the capture, detention and treatment of suspected terrorists during the Clinton, Bush and Obama administrations. The project was undertaken with the belief that it was important to provide an account as authoritative and accurate as possible of how the United States treated, and continues to treat, people held in our custody as the nation mobilized to deal with a global terrorist threat.

The Global Response Force (GRF) is built for rapid response to unforeseen or, more specifically, unplanned operations. This study illustrates a method for determining the best access strategies given constraints in aircraft, intermediate

staging bases, operational capabilities, and other factors. The study applies this method to each geographic combatant command and develops specific, tailored strategies for each.

A selection of case studies in the field of geographic citizen science casting insight on future research. Unbeknownst to them as they made their scientific discoveries, Isaac Newton, Charles Darwin, and other "gentlemen scientists" would later inspire a field of scientific practice and innovation known as citizen science. Today, the growth and availability of citizen science projects have been substantial, as anyone can now contribute to a scientific discipline without professional qualifications. As a subset of this movement, geographic citizen science presents a unique approach towards supporting the participation of everyday citizens in the collection, analysis, and dissemination of scientific data. This book presents a selection of wide-ranging case studies that provide insights into the design, interaction barriers, and lessons learned from a diverse set of participants. The volume captures the current status of research and development of geographic citizen science, providing critical insight to inform technological innovation and future research in this area.

As the so-called Arab Spring has slid into political uncertainty, lingering insecurity and civil conflict, European and American initial enthusiasm for anti-authoritarian protests has given way to growing concerns that revolutionary turmoil in North Africa may in fact have exposed the West to new risks. Critical in cementing this conviction has been the realisation that developments originated from Arab Mediterranean countries and spread to the Sahel have now such a potential to affect Western security and interests as to warrant even military intervention, as France's operation in Mali attests. EU and US involvement in fighting piracy off the Horn of Africa had already laid bare the nexus between their security interests and protracted crises in sub-Saharan Africa. But the new centrality acquired by the Sahel after the Arab uprisings – particularly after Libya's civil war – has elevated this nexus to a new, larger dimension. The centre of gravity of Europe's security may be swinging to Africa, encompassing a wide portion of the continental landmass extending south of Mediterranean coastal states. The recrudescence of the terrorist threat from Mali to Algeria might pave the way to an American pivot to Africa, thus requiring fresh thinking on how the European Union and the United States can better collaborate with each other and with relevant regional actors.

China and Russia are rising economic and political powers that share thousands of miles of border. Despite their proximity, their interactions with each other - and with their third neighbour Mongolia - are rarely discussed. Although the three countries share a boundary, their traditions, languages and worldviews are remarkably different. Frontier Encounters presents a wide range of views on how the borders between these unique countries are enacted, produced, and crossed. It sheds light on global uncertainties: China's search for energy resources and the employment of its huge population, Russia's fear of Chinese migration, and the precarious independence of Mongolia as its neighbours negotiate to extract its plentiful resources. Bringing together anthropologists, sociologists and economists, this

timely collection of essays offers new perspectives on an area that is currently of enormous economic, strategic and geo-political relevance.

Supply Chain Vulnerabilities and National Security Risks Across the U. S. Defense Industrial Base Wageningen Academic Publishers

In this monograph, the author sets the stage with a brief historical account of how maritime piracy has evolved over the centuries to its current state: a vast enterprise whose increasing profitability has attracted a confluence of nefarious actors including warlords and international criminal organizations. The author speculates on the potential for intersection between pirates and ideological terrorist movements such as al-Qaeda and Associated Movements. Such a future would significantly elevate the stakes in a U.S. whole-of-government counter-piracy response. What role should the U.S. military, and Special Operations Forces (SOF) in particular, play in addressing the global issue of maritime piracy? The author points out many of the thorny legal considerations that contextually color any efforts to address counter-piracy and notes that the best solution to criminal acts occurring hundreds of miles at sea may in fact lie with efforts, including the use of SOF, to improve the security apparatus on shore.

The United States' national security is threatened by our military's growing and dangerous reliance on foreign nations for the raw materials parts, and finished products needed to defend the American people. The health of our manufacturing sector is inextricably intertwined with our national security, and it is vital that we strengthen the sector. This report – prepared by Guardian Six Consulting LLC for the Alliance for American Manufacturing – recommends 10 actions to make America less dependent on foreign nations for the vital products that enable America's soldiers, sailors, airmen, and Marines to be the most powerful and effective fighting force in the world.

Bacteria are among the earliest forms of life on Earth.

Notwithstanding their small size and primitive origin, bacteria still have a tremendous impact on everyday human life. Over the centuries, research into bacteria have provided and enriched the fundamental biological knowledge due to their readily measured processes and effects on higher organisms. Although molecular genetics and microbiology were among the scientific fields that have mostly benefited from the discoveries made in bacteria, our current state of knowledge has gone beyond what anyone could have ever imagined. The present Research Topic aims to cover new and exciting broad aspects of the importance of bacteria to human life, both positive and negative influences. Regulation of bacterial gene expression, replication and segregation control mechanisms, cell to

cell communication via quorum sensors, and the relatively recent finding of bacterial immunity via CRISPR, have led to the development of many, and very important new tools in biotechnology and the emerging field of molecular medicine. The battle against infectious diseases has also benefited from the genetic approaches that have been developed in the quest for finding new targets and novel drugs against pathogenic bacteria. At the next level, the human microbiome project has opened up new avenues in understanding the role of bacteria in human health and wellbeing. Finally, the relationship between bacterial infections and human cancers will also be covered, a subject that is still under verification through rigorous experimental approaches. Special emphasis will be given to the bacterial accessory genome, i.e the mobilome, as the primary cause of health-threatening antimicrobial resistance and the production of toxins and virulence factors. Taking into account the evolutionary importance of horizontal gene transfer and the additional beneficial roles of certain bacterial mobile genetic elements, they help project best “the Good, the Bad and the Ugly” outline of this topic. At the time this eBook is about to be published, our Research Topic has registered nearly 55, 000 views.

In the new edition of this authoritative text, chapters have been thoroughly revised in line with major advances in the field, such as recognizing the increased frequency of fatty liver disease, and how genetic testing has the potential to establish earlier diagnoses for a variety of diseases. Disorders covered include cholestasis, metabolic disorders and hepatitis, with their presentation across the spectrum of infancy, childhood and adolescence discussed. The indications and surgical aspects of liver transplant are explained and post-transplant care is described in detail. This is a valuable resource for pediatricians, hepatologists, gastroenterologists and all clinicians involved in the care of children with liver diseases.

Casual stargazers are familiar with many classical figures and asterisms composed of bright stars (e.g., Orion and the Plough), but this book reveals not just the constellations of today but those of yesteryear. The history of the human identification of constellations among the stars is explored through the stories of some influential celestial cartographers whose works determined whether new inventions survived. The history of how the modern set of 88 constellations was defined by the professional astronomy community is recounted, explaining how the constellations described in the book became permanently “extinct.” Dr. Barentine addresses why some figures were tried and discarded, and also directs observers to how those figures can still be picked out on a clear night if one knows where to look.

These lost constellations are described in great detail using historical references, enabling observers to rediscover them on their own surveys of the sky. Treatment of the obsolete constellations as extant features of the night sky adds a new dimension to stargazing that merges history with the accessibility and immediacy of the night sky.

“[A] vivid, gripping account of inhuman cruelty, laced with rays of hope and courage and dignity amidst the horrors” (Noam Chomsky, leading public intellectual and author of *Hopes and Prospects*). A dramatic true story of men and women trapped in the grip of war, *Next Time They’ll Come to Count the Dead* is modern crisis reporting at its best. For six weeks in the spring of 2015, award-winning journalist Nick Turse traveled on foot, as well as by car, SUV, and helicopter, around war-torn South Sudan, talking to military officers and child soldiers, United Nations officials and humanitarian workers, civil servants, civil society activists, and internally displaced persons—people whose lives had been blown apart by a ceaseless conflict there. In a fast-paced and emotionally powerful fashion, Turse reveals the harsh reality of modern warfare in the developing world and the ways people manage to survive the unimaginable. *Next Time They’ll Come to Count the Dead* isn’t about combat. It’s about the human condition, about ordinary people thrust into extraordinary circumstances, and about death, life, and the crimes of war in the newest nation on earth. “The average journalist follows the herd of others. A bold one like Nick Turse goes to where the herd isn’t. His searing reporting in this book brings alive the suffering of a country that the United States, midwife to its birth, has largely forgotten.” —Adam Hochschild, author of *King Leopold’s Ghost* and *Mirror at Midnight*

An Anthropology of Landscape tells the fascinating story of a heathland landscape in south-west England and the way different individuals and groups engage with it. Based on a long-term anthropological study, the book emphasises four individual themes: embodied identities, the landscape as a sensuous material form that is acted upon and in turn acts on people, the landscape as contested, and its relation to emotion. The landscape is discussed in relation to these themes as both ‘taskscape’ and ‘leisurescape’, and from the perspective of different user groups. First, those who manage the landscape and use it for work: conservationists, environmentalists, archaeologists, the Royal Marines, and quarrying interests. Second,

those who use it in their leisure time: cyclists and horse riders, model aircraft flyers, walkers, people who fish there, and artists who are inspired by it. The book makes an innovative contribution to landscape studies and will appeal to all those interested in nature conservation, historic preservation, the politics of nature, the politics of identity, and an anthropology of Britain.

Between March and October 2011, a coalition of North Atlantic Treaty Organization (NATO) member states and several partner nations waged a war against Muammar Qaddafi's Libyan regime that stemmed and then reversed the tide of Libya's civil war, preventing Qaddafi from crushing the nascent rebel movement seeking to overthrow his dictatorship and going on to enable opposition forces to prevail. The central element of this intervention was a relatively small multinational force's air campaign operating from NATO bases in several countries, as well as from a handful of aircraft carriers and amphibious ships in the Mediterranean Sea. The study details each country's contribution to that air campaign, examining such issues as the limits of airpower and coordination among nations. It also explores whether the Libyan experience offers a potential model for the future.

This book questions the dominant Western narrative of security threats in Africa. By assessing the origins of the traditional approach to security and problematizing failed states, political instability, Muslim populations, and poverty, among others, it makes the case for a critical approach to framing security challenges in Africa.
