A "revolution" is taking place in the development of global information and communications technologies. In slightly more than a decade, the World Wide Web has gone from the idea of an obscure English scientist to a consumer-oriented technology system with an expected one billion users by 2005. The technologies that enable this to happen are advancing rapidly, which is leading to both an unprecedented number of start-up companies and a host of innovative new alliances between companies. The

growth has been so rapid and unexpected that little research and analysis has yet been done on what impact this transformation has had or will have on the ability of companies to meet the global sustainability challenge. As environmental strategy has traditionally been portrayed in terms of risk cutting and resource efficiency, there is a danger that critical business issues such as information technology, R&D and e-commerce development are examined in isolation from the wider sustainable business perspective. An important objective of the book is to explore, document and raise awareness of sustainability concerns arising from the emerging global information economy. The information economy is defined in the broadest sense possible, including software, hardware, telecommunication – traditional and wireless – and advanced communication technologies. Some of the key issues and questions that are examined include: Case studies on how and to what degree sustainability concerns are being integrated into the business model of electronic, telecommunication and dot.com firms. The relationship between the diffusion of information and communication technologies and the energy and resource intensity of companies. The role of information and communication technologies in the shaping of policies for sustainability, its impacts on sustainable or unsustainable lifestyles and its implications for the interaction between companies and other actors. Corporations and the global digital divide. The Ecology of the New Economy will be of interest to academics, governments, businesses, and non-governmental groups who are trying to understand the linkages and relationship between the two of our greatest global challenges: the information revolution and environmental sustainability.

Alex Cowie As the twentieth century draws to a close, one of our greatest problems is the availability of energy. One way to study the energy problem is to resolve it into four areas; energy demand, energy sources, transportation of energy from sources to demand centers, and the optimal allocation of energy forms to demands. Each of these areas is extremely complex by itself. When efforts are made to tie them together, for example, to produce a National Policy, the complexities are compounded. Another way to study the energy problem, because of its political and social consequences, is to resolve it into geographical areas. Individual provinces of Canada or states of the United States will have their concerns about energy within their geographical boundaries. As producer, consumer, or both, each wants to ensure an energy development program which will work to the maximum benefit of its

citizens. Similarly, countries endeavor to protect their citizens and undertake energy policies that will assure either a continuation of the existing quality of life or - particularly in the case of "Third World" countries - a marked improvement in quality of life. These competing and conflicting goals call for a study which encompasses the whole world. Again, complexity is piled upon complexity. If the problem is not yet sufficiently complex, there is an equally complex question of the effect of energy production and use on the ecology.

Phil Edmonston, Canada's automotive "Dr. Phil," pulls no punches. He says there's never been a better time to buy a new car or truck, thanks to a stronger Canadian dollar and an auto industry offering reduced prices, more cash rebates, low financing rates, bargain leases, and free auto maintenance programs. In this all-new guide he says: Audis are beautiful to behold but hell to own (biodegradable transmissions, "rodent snack" wiring, and mind-boggling depreciation) Many 2011-12 automobiles have "chin-to-chest head restraints, blinding dash reflections, and dash gauges that can't be seen in sunlight, not to mention painful wind-tunnel roar if the rear windows are opened while underway) Ethanol and hybrid fuel-saving claims have more in common with Harry Potter

than the Society of Automotive Engineers) GM's 2012 Volt electric car is a mixture of hype and hypocrisy from the car company that "killed" its own electric car more than a decade ago) You can save \$2,000 by cutting freight fees and "administrative" charges) Diesel annual urea fill-up scams can cost you \$300, including an \$80 "handling" charge for \$25 worth of urea) Lemon-Aid's 2011-12 Endangered Species List: the Chinese Volvo, the Indian Jaguar and Land Rover, the Mercedes-Benz Smart Car, Mitsubishi, and Suzuki
