The book focuses on the topic of bio-mineralization and discusses the properties of biological, biocompatible and biomimetic materials. The aim is to improve the performance of these materials. This can be accomplished by tailoring their surface properties by means of external factors and various surface modification techniques. In this way, the growth of biomaterials on surfaces can be influenced beneficially. Chapter 2 explores typical techniques for surface characterization and shows how these techniques can be modified to serve specific needs in the study of biomaterials. Chapters 3 and 4 reveal factors that can be used to influence the growth of the biomaterial hydroxyapatite (the main inorganic constituent in mammal bones and teeth). Proteins are also used to modulate the cellular interactions with the hydroxyapatite. The remaining chapters are devoted to an example of the pathological mineralization, namely the formation of bacterial films on teeth and soft tissues in the mouth and how it can be removed to achieve better oral health.
