The cardiovascular system has two distinct circulatory paths: Pulmonary circulation; Systemic circulation; The right side of the heart pumps blood to the lungs (pulmonary circulation). In the lungs blood gets oxygenated from the air sacs. At the same time, carbon dioxide diffuses into the air sacs and is exhaled into the atmosphere. Cardiovascular System Anatomy and Physiology: Study Guide ... The cardiovascular system is the body's main transport system. Its most important role is to deliver oxygenated blood, nutrients and chemical signals, such as hormones, to the organs and tissues. It also transports carbon dioxide to the lungs and waste products, such as urea and uric acid, to the kidneys for elimination.

The cardiovascular system is a closed system if the heart and blood vessels. The heart pumps blood through a closed system of blood vessels. Blood vessels allow blood to circulate to all parts of the body. Arteries usually colored red because oxygen rich, carry blood away from the heart to capillaries within the tissues.

The inside of the heart (heart cavity) is divided into four chambers – two atria and two ventricles – separated by cardiac valves that regulate the passage of blood. The heart is enclosed in a sac, the pericardium, which protects it and prevents it from over-expanding, anchoring it inside the thorax.

The circulatory system, also called the cardiovascular system or the vascular system, is an organ system that permits blood to

circulate and transport nutrients (such as amino acids and electrolytes), oxygen, carbon dioxide, hormones, and blood

cells to and from the cells in the body to provide nourishment and help in fighting diseases, stabilize temperature and pH, and

maintain homeostasis.
