Physiology Cardiovascular System - BrianMac

The cardiovascular system has two distinct circulatory paths: Pulmonary circulation; Systemic circulation; The right side of the heart pumps blood to the lungs (pulmonary circulation). In the lungs blood gets oxygenated from the air sacs. At the same time, carbon dioxide diffuses into the air sacs and is exhaled into the atmosphere.

The inside of the heart (heart cavity) is divided into four chambers – two atria and two ventricles – separated by cardiac valves that regulate the passage of blood. The heart is enclosed in a sac, the pericardium, which protects it and prevents it from over-expanding, anchoring it inside the thorax.

Circulatory system - Wikipedia

The circulatory system, also called the cardiovascular systemor the vascular system, is an organ systemthat permits
bloodto circulate and transport nutrients(such as amino acidsand electrolytes), oxygen, carbon dioxide, hormones,
and blood cellsto and from the cellsin the body to provide nourishment and help in fighting diseases, stabilize
temperatureand pH, and maintain homeostasis.

Circulatory System • Facts, Organs & Functions

The cardiovascular system is the body ' s main transport system. Its most important role is to deliver oxygenated
blood, nutrients and chemical signals, such as hormones, to the organs and tissues. It also transports carbon dioxide to
