The Ford 8.8- and 9-inch rear differentials are two of the most popular and bestperforming differentials on the market. While the 8.8-inch differential is commonly used in latemodel Mustangs, the 9-inch is the more popular and arguably the most dominant high-performance differential for muscle cars, hot rods, custom vehicles, and race cars. Built from

1957 to 1986, the 9-inch Ford differential is used in a huge range of highperformance Ford and non-Ford vehicles because of its rugged construction, easy-to-Currie, Moser and Strange set-up design, and large aftermarket support. The 9-inch differential effectively transmits power to the ground for many classic Fords and hot rods of all types, but it is the choice of many GM muscle car owners and racers as well. These differentials have been used extensively and proven their mettle in racing and high-performance applications. The Ford 8.8and 9-inch must be rebuilt after extensive use and need inspection and reassembly; a variety of different ratios for top performance and special applications. Benefits in the manufacturing process for the manufacturer often run counter to the interests of the end user. What speeds up production and saves manufacturing costs results in an engine that is made to fall within a wide set of standards and specifications, often not optimized to meet the original design. In short, cheap and fast engine production results in a sloppy final product. Of course, this is not what enthusiasts want out of their engines. To maximize the performance of any engine, it must be balanced and blueprinted to the exact tolerances that the factory should have adhered to in the first place. Four cylinder, V-8, American or import, the performance of all engines is greatly
