In industry, owners, engineers and workers have struggled with lubricant degradation and its effects on their equipment. The purpose of *Lubrication Degradation Mechanisms: A Complete Guide* is to help personnel to understand the reasons behind the degradation of their lubricant, determine methods to identify the onset of degradation and reduce or eliminate lubricant degradation within their equipment. One of the most common forms of lubricant degradation is oxidation. However, this is not the only

method by which a lubricant degrades. By understanding the differences between degradation patterns, personnel can employ specific tasks / tests to aid in their identification of the type of degradation and the factors responsible. The aim of this book is to educate facility personnel on the methods of degradation and ways in which it can be reduced or eliminated while keeping an eye on the cost of operation. This book deals with towage in the New Zealand ports. Due to the geographical location of New Zealand, the ports have to deal with very diverse nautical

conditions. It shows how regional councils decide what the best solution is for their port towing service. This has resulted in an interesting variety of tailor-made tugboats. However, in recent years there has been a development towards the use of more standard type of tugboats. Furthermore, this book deals with the commercial companies that operate from these ports. These are companies in the field of marine construction,

dredging, salvage and transport. The tugboats operated by those companies are also covered in this book. Peter J. Brom (1953) was born in Amsterdam. As a young man became fascinated by the many tugs in the Netherlands. Since then he has followed the towage industry and wrote about it, among other things in the monthly magazine Lekko. Since its first appearance in 1950, Pounder's Marine Diesel Engines has served seagoing engineers, students of the Certificates of Competency examinations and the marine engineering industry throughout the world. Each new edition has noted the changes in engine design and the influence of new technology and economic needs on the marine diesel engine. Now in its ninth edition, Pounder's retains the directness of approach and attention to essential detail that characterized its predecessors. There are new chapters on monitoring control and

HiMSEN engines as well as information on developments in electronic-controlled fuel injection. It is fully updated to cover new legislation including that on emissions and provides details on enhancing overall efficiency and cutting CO2 emissions. After experience as a seagoing engineer with the British India Steam Navigation Company, Doug Woodyard held editorial positions with the Institution of Mechanical Engineers and the Institute of Marine Engineers. He subsequently edited The Motor Ship journal for eight years before becoming a freelance

editor specializing in shipping, shipbuilding and marine engineering. He is currently technical editor of Marine Propulsion and Auxiliary Machinery, a contributing editor to Speed at Sea, Shipping World and Shipbuilder and a technical press consultant to Rolls-Royce Commercial Marine. * Helps engineers to understand the latest changes to marine diesel engines * Careful organisation of the new edition enables readers to access the information they require * Brand new chapters focus on monitoring control systems and

HiMSEN engines. * Over 270 high quality, clearly labelled illustrations and figures to aid understanding and help engineers quickly identify what they need to know.

Service Bulletin No. 4. f. Auxiliary air devices should never be used on the "Caterpillar" Engine. If the carbureter is in correct carbureter adjustment, there is nothing that an auxiliary air device can do to add to the efficiency of the mixture. It is not possible to get an accurate carbureter adjustment with the use of an auxiliary air device. All the air for the mixture must pass through the carbureter to secure perfect vaporization of the fuel. If maximum fuel economy of the engine is not obtained with the carbureter, it may be that the adjustment is unbalanced somewhere. The necessary mechanism in the form of an air valve and spring is incorporated in the carbureter to obtain every adjustment as far as air is concerned. After a while the auxiliary air device will leak air and be a source of constant annoyance, and can be a fertile cause of engine overheating. Carbon 153--The first and most important consideration in keeping an engine free from carbon is the complete combustion of the fuel, as from this source the largest proportion of carbon is deposited. For further detail, see

Service Bulletin No. 5 on carbon and carbon troubles. Valves Must Operate Correctly 154--To secure a perfect carbureter adjustment, the valves must seat perfectly and open and close correctly. Before proceeding with the carbureter adjustment it is absolutely necessary to be sure that when the cam is disengaged on each particular valve rod guide, all

the slack is taken up on the valve tappet, valve rod and rocker arm, so that the rocker arm has a clearance of one thirtysecond of an inch over the valve stem. This distance must not be varied.
