Corpora are ubiquitous in linguistic research, yet to date, there has been no consensus on how to conceptualize corpus representativeness and collect corpus samples. This pioneering book bridges this gap by introducing a conceptual and methodological framework for corpus design and representativeness. Written by experts in the field, it shows how corpora can be designed and built in a way that is both optimally suited to specific research agendas, and adequately representative

of the types of language use in question. It considers questions such as 'what types of texts should be included in the corpus?', and 'how many texts are required?' – highlighting that the degree of representativeness rests on the dual pillars of domain considerations and distribution considerations. The authors introduce, explain, and illustrate all aspects of this corpus representativeness framework in a step-by-step fashion, using examples and activities to help readers develop practical skills in corpus design and evaluation. Advances in wireless and broadband technologies and trends such as pervasive networks, fixed-mobile convergence, seamless communication and sensor networks will have a broader impact and an

even more profound influence on the way we live than the personal computer, PDA, cellular phone and Internet had from 1995-2005. Always on and ubiquity, the credos of today's ICT market, have already become customer demands. Under constraint to satisfy these demands, generate new service revenues, and retain higher percentages of existing customers worldwide, operating telecommunication companies have to break new ground.

Personalization is considered a key differentiator in the increasingly competitive landscape. With the increasing proliferation of service types and features, a personal

intelligent user interface will enable higher customer utility and also make new service scenarios possible. The main problem areas discussed in this thesis are technology forecast and usability evaluation of a new technology. Two well known quotations as follows will introduce the problem of technology forecasting. This 'telephone' has too many shortcomings to be seriously considered as a means of communication. The device is inherently of no value to us. A more contemporary the following statement by William Gates III from 1981: 640Kbyte ought to be enough for anybody. These statements might cause amazement, especially considering the

fact that both companies are still in business. Admittedly, as the telephone replaced the telegraph, money transfer became the Western Union Telegraph Company's primary line of business. However, this begs the question how such companies were even capable of surviving such major misjudgements regarding their strategic technology alignment. Generally speaking, the only possible strategies were changing the focus of their business (as was the case with Western Union), simply getting lucky or, alternatively, having enough money to assimilate the missing technology through purchases. But it can't be the goal of a global player

to miss or lose millions and, in the case of a small firm, to go out of business simply because the chief executive or the person in charge misdiagnosed strategic technology [...]
