This book was created to help teachers as they instruct students through the Master's Class Chemistry course by Master Books. The teacher is one who guides students through the subject matter, helps each student stay on schedule and be organized, and is their source of accountability along the way. With that in mind, this guide provides additional help through the laboratory exercises, as well as lessons, quizzes, and examinations that are provided along with the answers. The lessons in this study emphasize working through procedures and problem solving by learning patterns. The vocabulary is kept at the essential level. Practice exercises are given with their answers so that the patterns can be used in problem solving. These lessons and laboratory exercises are the result of over 30 years of teaching home school high school students and then working with them as they proceed through college. Guided labs are provided to enhance instruction of weekly lessons. There are many principles and truths given to us in Scripture by the God that created the universe and all of the laws by which it functions. It is important to see the hand of God and His principles and wisdom as it plays out in chemistry. This course integrates what God has told us in the context of this study. Features: Each suggested weekly schedule has five easy-to-manage lessons that combine reading and worksheets. Worksheets, quizzes, and tests are perforated and three-hole punched — materials are easy to tear out, hand out, grade, and store. Adjust the schedule and materials needed to best work within your educational program. Space is given for assignments dates. There is flexibility in scheduling. Adapt the days to your school schedule. Workflow: Students will read the pages in their book and then complete each section of the teacher guide. They should be encouraged to complete as many of the activities and projects as possible as well. Tests are given at regular intervals with space to record each grade. About the Author: DR. DENNIS ENGLIN earned his bachelor's from Westmont College, his master of science from California State University, and his EdD from the University of Southern California. He enjoys teaching animal biology, vertebrate biology, wildlife biology, organismic biology, and astronomy at The Master's University. His professional memberships include the Creation Research Society, the American Fisheries Association, Southern California Academy of Sciences, Yellowstone Association, and Au Sable Institute of Environmental Studies.

This work focuses on the developments related to lycopene, a natural carotenoid and bioactive compound, particularly with reference to its chemistry and biological activity and its potential health effects. The formation of free radicals or other compounds in the body that are able to oxidize lipids, proteins, and DNA (also known as oxidative stress) is one of the major risk factors for chronic diseases. There is considerable evidence that lycopene has a protective effect against cardiovascular disease, hypertension, atherosclerosis, skin damage, and certain types of cancer such as prostate, breast, lung, and others. Because of this, the presence of lycopene in the diet is considered to be of great value. Dietary lycopene may increase the lycopene level in the body and act as an antioxidant. It may trap reactive oxygen species resulting in an increase in the overall antioxidant potential or a reduction in the oxidative damage to lipids (lipoproteins, membrane lipids), proteins (important enzymes), and DNA (genetic material), thereby lowering the oxidative stress. Alternatively, the increase in serum lycopene level may regulate gene functions, with the enhancement of intercellular communication (responsible for cell growth), modulating hormonal and immune response, regulating metabolism, and thus lowering the risk of chronic diseases. These mechanisms may also be interrelated and may act simultaneously to provide health benefits. Lycopene is quickly absorbed from different food sources (mainly tomato products) and distributed to corporal tissues where it maintains its antioxidant properties. This absorption varies depending on various factors such as food source, food processing, and other components in the diet. The human body is unable to synthesize carotenoids, such as lycopene, so a suitable diet intake is necessary to reach the adequate levels. In this review, the new developments in lycopene analysis by spectroscopic and chromatographic techniques along with mathematical modeling are also considered. These advances have made it possible to evaluate and determine the biological activity of lycopene in natural products. All this knowledge about the chemistry and biological activity of lycopene will be very helpful for the food industry, providing new opportunities in the field of food product development.
