This study fills a gap in standardization literature. It is the first academic analysis of national standardization organizations. These organizations exist in every country and may be private or governmental organizations. The first national standardization organizations were founded in the early decades of the 20th century and were aimed at rationalizing industrial production. Their mode of operation reflects the sense of co operation at the national level and - in the telecommunications and electrotechnical field - at the international level as well. Now, however, the scene has changed, with companies operating internationally. Standards for products,

processes, and services are crucial factors in determining success or failure on a fiercely competitive market, especially when functional compatibility is a prerequisite, as is the case in computer and telecommunications technologies. As a consequence, rather homogeneous needs of participants in standardization have given way to conflicting interests. This prompts a discussion about the traditional role of national standardization organizations. They increasingly depend on their exclusive links to the international standardization organizations ISO and IEC, and, in the case of Europe, the regional organizations CEN and CENELEC. In many cases, formal standardization organizations are not the obvious bodies for developing standards to meet business

needs. Is this inevitable or could they improve performance and regain their market share? Henk de Vries answers this question against the background of current developments in standardization at the international, European, and national levels.

Education (UK)

Access to the Internet is an increasing problem in many areas of the world. As the popularity and usefulness of the Internet increases on a daily basis, lack of access to the technology is putting many groups at a disadvantage in terms of better education, better jobs and even in terms of higher levels of civic participation. However, creating a network infrastructure to serve outlying communities and sectors of the population is not straight-forward. This book brings together all the aspects of the problem – technical, regulatory and economic - into one volume to provide a comprehensive resource. It describes the latest technological advances that allow cost-effective network infrastructures to be built, and places them in the

context of the applications and services that the infrastructure will deliver. A section on business models and case studies from North American and Europe demonstrate that the solutions are economically and practically viable. This book is essential for anyone looking to gain an understanding of the issues and technology surrounding the access debate. It will be of particular relevance to network engineers/designers/planners at the incumbent operator companies charged with delivering broadband access to as yet unconnected regions. Governments and regulatory bodies will also find this a useful guide to the problems that they may face.
