Genomics III Academic Press

In the 1960's and 1970's, personality and mental illness were conceptualized in an intertwined psychodynamic model. Biological psychiatry for many unweaved that model and took mental illness for psychiatry and left personality to psychology. This book brings personality back into biological psychiatry, not merely in the form of personality disorder but as part of a new intertwined molecular genetic model of personality and mental disorder. This is the beginning of a new conceptual paradigm!! This breakthrough volume marks the beginning of a new era, an era made possible by the electrifying pace of discovery and innovation in the field of molecular genetics. In fact, several types of genome maps have already been completed, and today's experts confidently predict that we will have a smooth version of the sequencing of the human genome -- which contains some 3 billion base pairs Such astounding progress helped fuel the development of this remarkable volume, the first ever to discuss the brand-new -- and often controversial -- field of molecular genetics and the human personality. Questioning, critical, and strong on methodological principles, this volume reflects the point of view of its 35 distinguished contributors -- all pioneers in this burgeoning field and themselves world-class theoreticians, empiricists, clinicians, developmentalists, and statisticians. For students of psychopathology and others bold enough to hold in abeyance their understandable misgivings about the conjunction of "molecular genetics" and "human personality," this work offers an authoritative and up-to-date introduction to the molecular genetics of human personality. The book, with its wealth of facts, conjectures, hopes, and misgivings, begins with a preface by world-renowned researcher and author Irving Gottesman. The authors masterfully guide us through Chapter 1, principles and methods; Chapter 4, animal models for personality; and Chapter 11, human intelligence as a model for personality, laying the groundwork for our appreciation of the remaining empirical findings of human personality qua personality. Many chapters (6, 7, 9, 11, and 13) emphasize the neurodevelopmental and ontogenetic aspects of personality, with a major emphasis on the receptors and transporters for the neurotransmitters dopamine and serotonin. Though these neurotransmitters are a rational starting point now, the future undoubtedly will bring many other candidate genes that today cannot even be imagined, given our ignorance of the genes involved in the prenatal development of the central nervous system. Chapter 3 provides an integrative overview of the broad autism phenotype, and as such will be of special interest to child psychiatrists. Chapters 5, 8, and 10 offer enlightening information on drug and alcohol abuse. Chapter 14 discusses variations in sexuality. Adding balance and mature perspectives on how all the chapters complement and sometimes challenge one another are Chapter 2, written by a major figure in the renaissance of the relevance to psychopathology of both genetics and personality; Chapters 15-17, informed critical appraisals citing concerns and cautions about premature applications of this information in the policy arena; and Chapter 18, a judicious contemplation by the editors themselves of this promising -- and, to some, alarming -- field. Clear and meticulously researched, this eminently satisfying work is written to introduce the subject to postgraduate students just beginning to develop their research skills, to interested psychiatric practitioners, and to informed laypersons with some scientific background.

Genomics is the study of the genomes of organisms. The field includes intensive efforts to determine the entire DNA sequence of organisms and fine-scale genetic mapping efforts. It is a discipline in genetics that applies recombinant DNA, DNA sequencing methods, and bioinformatics to sequence, assemble, and analyze the function and structure of genomes. Genomics I - Humans, Animals and Plants is the first volume of our Genomics series. There are totally three volumes in this series. Chapter 1 describes the development of a unique nascent DNA enrichment peak detection algorithm which utilizes Savitzky-Golay convolution kernel smoothing at different base-pair resolutions. Chapter 2 summarizes disease-causing mutations in the human genome which affect RNA splicing. Chapter 3 discusses Reactive oxygen species (ROS), which are reactive ions and free radicals generated by oxidative reactions. ROS can damage cells by reacting with cellular macromolecules including DNA. Chapter 4 proposes a methodological approach to analyze telomeric chromatin structure independently of Interstitial Telomeric Sequences (ITSs). The method is based on the use of the frequently cutting enzyme Tru9I. In Chapter 5, the authors detail recent advances in understanding mechanisms of gene regulation in Drosophila. A combination of molecular genetics and mathematical modeling approaches reveals the emerging evidence for an underlying architecture of transcription factor binding sites in cis-regulatory modules. Chapter 6 provides a systematic evaluation and general summary of the gene expression spectra of drug metabolizing enzymes and transporters (DMETs). Chapter 7 addresses the problem of determination of absolute copy numbers in the tumor genomic profile measured by a single nucleotide polymorphism array. Chapter 8 describes bioinformatics of computer-based reconstruction of the mitochondrial DNA sequences of extinct hominin lineages and demonstrates how to identify evolutionary important information that these ancestral DNA sequences provide. Chapter 9 proposes a phylogenetic identity of human and monkeys chlamydial strains and role of plasmids and causative agents genotypes in chlamydiosis pathogenesis. Defined the relationship between plasmid presence and IncA protein activity. In Chapter 10, based on a comparison of seven different inbred mouse strains in a model of chemical-induced asthma, it demonstrates the genetic background of the different mouse strains has a large impact on the phenotypical outcome of TDI-induced asthma and suggests caution has to be taken when comparing results from different mouse strains. Chapter 11 reviews the phylogenetic study of rabies virus emergence in wild carnivores in Turkey using viral genomic sequence analysis. It also considers options for control rabies using oral vaccination and how phylogenetic information can support attempts to control the disease. Chapter 12 reveals global transcriptomic changes that occur during germination in plants. The methods of analyzing high-throughput data in plants are described and the biological significance of these transcriptomic changes are discussed. Chapter 13 discusses the different covalent histone modifications in plants and their role in regulating gene expression and focuses on the SET-domain containing proteins belonging to the Polycomb-Group (PcG) and trithorax-Group (trxG) protein complexes and their targets in plants. Chapter 14 describes a genome-wide strategy to identify high-identity segmental duplications, combine molecular cytogenetics assays.. In Chapter 15, the authors introduce a map-based cloning and functional identification of a rice gene that plays an important role for the substance storage in the endosperm. In Chapter 16, three deep-sequencing studies are presented, which were included in a project develop of a specific biocontrol strategy for sustainable agriculture in desert ecosystems.
