**Molecular Biology** Concepts of Biology Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts. Neurogenetics is intended for any physician or scientist who manages patients with inherited diseases of the nervous system. It presents the clinical phenotypes of the most commonly inherited neurologic diseases, and their

molecular pathogenesis, followed by a description of the appropriate tests to be used in diagnosis. Two introductory chapters familiarize the nongeneticist with medical genetic terminology and molecular genetic techniques useful in the analysis of genetic disease and genetic testing. Subsequent chapters examine major neurologic disorders caused by single defects, as well as disease phenotypes such as Alzheimer disease or amyotrophic lateral sclerosis which may be caused by defects in single genes, but may also be seen as sporadic diseases. The genetic components of other common neurologic disorders, such as epilepsy, multiple sclerosis, migraine, and stroke are all covered in detail. The final chapter discusses genetic counseling of symptomatic and pre-symptomatic individuals. Throughout, chapters discuss genotype/phenotype correlations and, where appropriate, animal models for inherited human neurologic diseases. Several chapters are devoted to recently discovered diseases caused by unstable DNA repeats. Special emphasis is placed on conveying how DNA testing can be applied to the daily practice of geneticists and neurologists.

Advances in genomics are expected to play a central role in medicine and public health in the future by providing a genetic basis for disease prediction and prevention. The transplantation of human gene discoveries into meaningful actions to improve health and prevent disease depends on scientific information from multiple disciplines, including epidemiology. This book describes the important role that epidemiologic methods play in the continuum from gene discovery to the development and application of genetic tests. It proceeds systematically from the fundamentals of genome technology and gene discovery, to epidemiologic approaches to gene characterization in the population, to the evaluation of genetic tests and their use in health services. These methodologic approaches are then illustrated with several disease-specific case studies. The book provides a scientific foundation that will help researchers, policy makers, and practitioners integrate genomics into medical and public health practice.

The Evolution of Parental Care Harper Collins

Collectively autoimmune diseases constitute a major burden to society. Though the etiology of autoimmune diseases remain largely unknown, evidence supports a substantial genetic component. For many autoimmune diseases, twin studies demonstrate a dramatically higher disease concordance rate in monozygotic twins than in dizygotic twins. Genes in the major histocompatibility complex (MHC) region on the short arm of chromosome 6, particularly the human leukocyte antigen (HLA) class II genes, are strongly associated with risk of developing rheumatoid arthritis (RA), systemic lupus erythematosus (SLE), multiple sclerosis (MS) and type 1 diabetes (T1D). The MHC class II transactivator gene (CIITA, also called MHC2TA), located on the short arm of chromosome 16, encodes an important transcription factor (CIITA) regulating the genes required for HLA class II MHC-restricted antigen presentation. Thus CIITA is a strong biological candidate for studies of autoimmune disease. Directly adjacent to CIITA lies the C-type lectin domain family 16, member A gene (CLEC16A, previously called KIAA0350). CLEC16A is a sugar binding receptor containing a putative immunoreceptor and was recently identified as a novel T1D and MS susceptibility locus through genome-wide association (GWA) studies. HLA may also influence susceptibility to autoimmune disease through other inherited and noninherited mechanisms, in addition to genetic transmission of risk alleles. Evidence for increased maternal-offspring HLA compatibility and differences in both maternal vs. paternal transmission rates (parent-of-origin effects) and nontransmission rates (noninherited maternal antigen (NIMA) effects) in autoimmune diseases have been reported. The investigation described in this dissertation tested hypotheses that (1) the CIITA -168A/G promoter polymorphism (rs3087456) influences susceptibility to RA (Chapter 2); (2) common genetic variation in CIITA influences susceptibility to RA in a case-control study (Chapter 3); (3) common genetic variation in CIITA influences susceptibility to SLE or specific secondary SLE phenotypes (Chapter 4); (4) common genetic variation in CIITA influences susceptibility to MS (Chapter 5); (5) common genetic variation in CLEC16A influences susceptibility to RA (Chapter 6); (6) the HLA class II DRB1 locus influences susceptibility to SLE through maternal-offspring HLA compatibility, parent-of-origin and NIMA effects (Chapter 7); and (7) the HLA classical loci influence susceptibility to T1D through maternal-offspring HLA compatibility, parent-of-origin and NIMA effects (Chapter 8). This dissertation includes the first study to fully characterize common genetic variation in CIITA and CLEC16A, including assessment of haplotypes, sex-specific effects, secondary clinical phenotypes and HLA risk alleles. Results do not provide evidence for association between CIITA and RA or SLE or for association between CLEC16A and RA. Interestingly, this study revealed evidence for an association between the CIITA missense mutation rs4774 and increased risk for MS in the presence of the HLA-DRB1\*1501 risk allele. There was no linkage disequilibrium between CIITA and CLEC16A, and the observed association between CIITA and MS in the presence of HLA-DRB1\*1501 was independent of

the association between CLEC16A and MS. The first studies to examine maternal-offspring HLA compatibility in T1D and HLA-DRB1 parent-of-origin and NIMA effects in SLE, and the largest study to examine maternal-offspring HLA compatibility in SLE and HLA parent-of-origin and NIMA effects in T1D were also performed. No evidence that the HLA-DRB1 locus influences risk for SLE or that the classical HLA loci influence risk for T1D through these novel biological phenomena was revealed.
