Integrated analysis of tissue histology with the genome-wide array and clinical data has the potential to generate hypotheses as well as be prognostic. However, due to the inherent technical and biological variations, automated analysis of whole mount tissue sections is impeded in very large datasets, such as The Cancer Genome Atlas (TCGA), where tissue sections are collected from different laboratories. We aim to characterize tumor architecture from hematoxylin and eosin (H&E) stained tissue sections, through the delineation of nuclear regions on a cell-by-cell basis. Such a representation can then be utilized to derive intrinsic morphometric subtypes across a large cohort for prediction and molecular association. Our approach has been validated on manually annotated samples, and then applied to a Glioblastoma Multiforme (GBM) cohort of 377 whole slide images from 146 patients. Further bioinformatics analysis, based on the multidimensional representation of the nuclear features and their organization, has identified (i) statistically significant morphometric sub types; (ii) whether each subtype can be predictive or not; and (iii) that the molecular correlates of predictive subtypes are consistent with the literature. The net result is the realization of the concept of pathway pathology through analysis of a large cohort of whole slide images.

The Routledge Handbook of Research Methods for Social-Ecological Systems provides a synthetic guide to the range of

methods that can be employed in social-ecological systems (SES) research. The book is primarily targeted at graduate

students, lecturers and researchers working on SES, and has been written in a style that is accessible to readers entering the

field from a variety of different disciplinary backgrounds. Each chapter discusses the types of SES questions to which the

particular methods are suited and the potential resources and skills required for their implementation, and provides practical

examples of the application of the methods. In addition, the book contains a conceptual and practical introduction to SES

research, a discussion of key gaps and frontiers in SES research methods, and a glossary of key terms in SES research.

Contributions from 97 different authors, situated at SES research hubs in 16 countries around the world, including South Africa,

Sweden, Germany and Australia, bring a wealth of expertise and experience to this book. The first book to provide a guide and

introduction specifically focused on methods for studying SES, this book will be of great interest to students and scholars of

sustainability science, environmental management, global environmental change studies and environmental governance. The

book will also be of interest to upper-level undergraduates and professionals working at the science-policy interface in the

environmental arena.
