Example (Problem 2.23 textbook) The steady-state temperature distribution in a one-dimensional wall of thermal conductivity $50 \text{ W/m}\cdot\text{K}$ and thickness 50 mm is observed to be $T (\text{ }^\circ\text{C}) = a + bx^2$, where $a = 200 \text{ }^\circ\text{C}$, $b = -2000 \text{ }^\circ\text{C/m}^2$, and x is in meters. a) What is the heat generation rate in the wall? b) Determine the heat fluxes at the two wall faces.

Steady-State Conduction— Multiple Dimensions

2 Steady, One-Dimensional Heat Conduction In this chapter we will treat the simplest possible type of heat transfer process, i.e., energy transport in the absence of convection and radiation (heat conduction), independent of time (steady), and only one component of the heat flux vector being nonzero (one-dimensional).

One-Dimensional Steady-State Conduction

temperatures while the side surface is perfectly insulated will vary linearly during steady one-dimensional heat conduction. This is because the steady heat conduction equation in this case is $\frac{d^2 T}{dx^2} = 0$ whose solution is $T(x) = +T_1 x + C_1 x^2$ which represents a straight line whose slope is C_1 .
