Empirical Metallogeny: Depositional Environments, Lithologic Associations, and Metallic Ores, Vol. 1: Phanerozoic Environments, Associations, and Deposits focuses on the composition, characteristics, properties, and reactions of Phanerozoic metallic ore deposits. The book first offers information on depositional environments and lithologic associations and the world ocean, including ores and host associations, sea water as a metal source, and metals in marine organisms. The text then elaborates on continental margins, orogenic belts, and ophiolite association. Discussions focus on metal geochemistry and metallogeny, tectonic setting and distribution of ophiolites, trace metals and ore evolution, and supracrustal lithologic associations of orogenic belts. The publication tackles zoned mafic/ultramafic complexes in Phanerozoic orogenic belts; unimodal mafic volcanic-sedimentary association; and unimodal felsic volcanic-sedimentary association. Topics include post-depositional modification of massive sulfides, and interaction mineralization and massive tholeiitic basalt flows and arc affiliation. The book is a dependable source of information for readers wanting to study metallic ores.

Experiments for Living Chemistry provides practical, "hands-on" experiments illustrating the concepts, substances, and techniques that are important to students in the health-related sciences. Many of these experiments are based on physiological substances to show students how chemical principles apply to the functioning of their own bodies, while other experiments use cut-outs to help students visualize such complex concepts as bonding and protein synthesis. This book is organized into 23 chapters that correspond on a chapter by chapter basis with the Living Chemistry textbook. The first five chapters include discussions on matter, measurement, chemical bonding, compounds, chemical change, gases, and respiration. The subsequent chapters deal with water, solutions, acids, bases, salts, hydrocarbons, and nuclear and organic chemistry. Other chapters explore the oxygen and other derivatives of the hydrocarbons, carbohydrates, lipids, proteins, enzymes, and digestion. Considerable chapters are devoted to the metabolism of carbohydrate, energy, lipid, and proteins. The remaining chapters examine the heredity and protein synthesis, vitamins, hormones, body fluids, drugs, and poisons. At the end of each chapter, there are sets of questions designed to help the student relate the laboratory experiments to the textbook and to the lecture portion of the course. Each experiment in the chapter has a corresponding question set that should be answered only after the experiment has been completed. This book is an invaluable study guide to chemistry teachers and undergraduate students.

The image on the front cover depicts a carbon nanotube emerging from a glowing plasma of hydrogen and carbon, as it forms around particles of a metal catalyst. Carbon nanotubes are a recently discovered allotrope of carbon. Three other allotropes of carbon-buckyballs, graphite, and diamond-are illustrated at the left, as is the molecule methane, CH<sub>4</sub>, from which nanotubes and buckyballs can be made. The element carbon forms an amazing number of compounds with structures that follow from simple methane, found in natural gas, to the complex macromolecules that serve as the basis of life on our planet. The study of chemistry also follows from the simple to the more complex, and the strength of this text is that it enables students with varied backgrounds to proceed together to significant levels of achievement.
