Experiments for Living Chemistry provides practical, "hands-on" experiments illustrating the concepts, substances, and techniques that are important to students in the health-related sciences. Many of these experiments are based on physiological substances to show students how chemical principles apply to the functioning of their own bodies, while other experiments use cut-outs to help students visualize such complex concepts as bonding and protein synthesis. This book is organized into 23 chapters that correspond on a chapter by chapter basis with the Living Chemistry textbook. The first five chapters include discussions on matter, measurement, chemical bonding, compounds, chemical change, gases, and respiration. The subsequent chapters deal with water, solutions, acids, bases, salts, hydrocarbons, and nuclear and organic chemistry. Other chapters explore the oxygen and other derivatives of the hydrocarbons, carbohydrates, lipids, proteins, enzymes, and digestion. Considerable chapters are devoted to the metabolism of carbohydrate, energy, lipid, and proteins. The remaining chapters examine the heredity and protein synthesis, vitamins, hormones, body fluids, drugs, and poisons. At the end of each chapter, there are sets of questions designed to help the student relate the laboratory experiments to the textbook and to the lecture portion of the course. Each experiment in the chapter has a corresponding question set that should be answered only after the experiment has been completed. This book is an invaluable study guide to chemistry teachers and undergraduate students.

"It is said if you take care of the pennies, the pounds will take care of themselves. Richard Burton's excellent book takes this approach to calculations applied to the biomedical sciences...This is certainly interesting and engaging but it avoids being complicated." – Journal of Biological Education, April 2009 Biomedical Calculations: Principles and Practice is an accessible, student-friendly introduction to calculating, applying formulae and solving quantitative problems within these subjects. This book targets a problem area for many students and aims to give them the confidence which they are so often lacking when undertaking scientific calculations. It takes a unique approach to the subject and uses unit analysis as a central theme throughout the book to enhance student understanding. Clearly structured throughout, little basic knowledge of mathematics is assumed, but even the most numerate readers will be interested in the sometimes-novel biological detail. Numerous worked examples, supplementary questions and practice problems are provided and although the book is written to be read in sequence, it will also be a useful reference. The central theme of the book focuses on the value of unit analysis in solving quantitative problems, with explanations on how to avoid errors in calculations and in checking, understanding and deriving formulae and equations. As a background to this, there is extensive treatment of physical units, both individually (e.g. kg, m, mmol) and in combination (e.g. m s⁻², mmol L⁻¹), and also of other aspects of quantitative thinking. A variety of topics (mostly from physiology, pharmacology and biochemistry) are used to demonstrate these calculations in practice. Key features: An accessible, student-friendly introduction for all those hesitant in calculating, applying formulae and solving quantitative problems An innovative approach to scientific calculations and how to work with unfamiliar formulae for the biomedical and life sciences Includes modern, up to date definition of pH eliminating the need for logarithms and a discussion of the importance of pH Clear introduction on how to use the book, guidance on units and unit conversion, and an appendix on basic mathematics and notation Use of unit analysis as a central theme Includes numerous worked examples and supplementary questions throughout the text
