When did drawing become an integral part of architecture? Among several architects and artists who brought about this change during the Renaissance, Francesco di Giorgio Martini’s ideas on drawing recorded in his Trattati di architettura, ingegneria e arte militare (1475-1490) are significant. Francesco suggests that drawing is linked to the architect’s imagination and central in conveying images and ideas to others. Starting with the broader edges of Francesco’s written work and steadily penetrating into the fantastic world of his drawings, the book examines his singular formulation of the act of drawing and its significance in the

context of the Renaissance. The book concludes with speculations on how Francesco’s work is relevant to us at the onset of another major shift in architecture caused by the proliferation of digital media.

The accidental hunting death of his eight-year-old son caused attorney Paul Dixon to go off on a wild tangent, costing him his marriage, his law career, and much, much more. He quit his position at the law firm where he was employed and left town after his divorce was final. He went into seclusion, changed his identity to Sam Little, and carefully conceived a plan to seek out the family members of those victims whose loved ones had suffered violence at the hands of the criminals in our society—criminals who had not received the full punishment of the justice system due to technicalities, loop holes in the law, crooked police, crooked judges, or slick-talking lawyers. Dixon's plans would be financed by those family members who felt they were cheated by the system, and the custom plans would be carried out by Sam Little's select few hand-chosen associates. This is a Meredith story of such mystery, suspense, and intrigue, that the reader will find it difficult to lay it aside.

Papers presented at the Thirteenth International Conference on Patristic Studies held in Oxford 1999 (see also Studia Patristica 34, 36, 37 and 38). The successive sets of Studia Patristica contain papers delivered at the International Conferences on Patristic Studies, which meet for a week once every four years in Oxford; they are held under the aegis of the Theology Faculty of the University. Members of these conferences come from all over the world and most offer papers. These range over the whole field, both East and West, from the second century to a

section on the *Nachleben* of the Fathers. The majority are short papers dealing with some small and manageable point; they raise and sometimes resolve questions about the authenticity of documents, dates of events, and such like, and some unveil new texts. The smaller number of longer papers put such matters into context and indicate wider trends. The whole reflects the state of Patristic scholarship and demonstrates the vigour and popularity of the subject.

Neuroendocrinology John Libbey Eurotext

This book provides a critical study of how China was represented on the historical London stage in selected examples from the late seventeenth century to the early twentieth century—which corresponds with the Qing Dynasty (1644-1911), China's last monarchy. The examples show that during this historical period, the stage representations of the country were influenced in turn by Jesuit writings on China, Britain's expanding material interest in China, the presence of British imperial power in Asia, and the establishment of diasporic Chinese communities abroad. While finding that many of these works may be read as gendered and feminized, Chang emphasizes that the Jesuits' depiction of China as a country of high culture and in perennial conflict with the Tartars gradually lost prominence in dramatic imaginations to depictions of China's material and visual attractions. Central to the

book ' s argument is that the stage representations of China were inherently intercultural and open to new influences, manifested by the evolving combinations of Chinese and English (British) traits. Through the dramatization of the Chinese Other, the representations questioned, satirized, and put in sharp relief the ontological and epistemological bases of the English (British) Self.

Neuroendocrinology, Volume II, is the second in a two-volume treatise designed to provide a survey of all aspects of the rapidly expanding science of neuroendocrinology. Only in recent years have the relations between the nervous system and the endocrine system come under intensive scrutiny, but their interactions have already been shown to be multiple and diverse. This diversity is reflected in the range of subjects covered. There are chapters on neural control of endocrine function; the effects of hormones on the brain; brain-endocrine interrelations during various phases of development; and the comparative aspects of neuroendocrine integration. The relation of brain chemistry to endocrine function, the effect of drugs on neuroendocrine mechanisms, and the new discipline of clinical neuroendocrinology have also been considered. Not only neurophysiologists and endocrinologists, but pharmacologists, zoologists, biochemists, psychologists, and those in clinical medicine will find the treatise of interest. Parts of neuroendocrinology have been discussed in other works, but this is the first treatise in which an attempt has been made to cover all

ramifications of neuroendocrinology. This book can be used both as a text for advanced students and as a reference source.
