Motion. Summary

Introduction In the earlier chapters we discussed the motion of particle. We applied the results of our study to the motion of bodies of finite size. A large class of problems with extended bodies can be solved by considering them to be rigid bodies. Chapter 8: Rotational Motion. If
you ride near the outside of a
merry-go-round, do you go faster
or slower than if you ride near
the middle? It depends on

whether “ faster ” means . a
faster linear speed (= speed), ie
more distance covered per
second, or - a faster rotational
speed (=angular speed, w), i.e.
more . rotations or revolutions ...

reduce this chapter entirely to
the questions of the workbook.
Work through these question
using your text. Most of the
questions can be answered
without reading the textbook, but
relying of the work we did at
circular motion.

This physics video tutorial
provides a basic introduction into
rotational motion. It describes
the difference between linear
motion or translational motion
and rotational motion.

Chapter 7 Rotational Motion and Gravitation Chapter 7: Circular Motion & Rotation 163 Objectives

1. Explain the acceleration of an object moving in a circle at constant speed. 2. Define centripetal force and recognize that it is not a special kind of force, but that it is provided by forces such as tension, gravity, and friction.

motion | physics class 11

In our day to day life, we come
across many objects which show
rotational motion, the spinning
of car wheels, rotation of washing
machine agitator, rotation of the
earth etc. Before you proceed
further in this chapter, you
should know what is a rigid body,
a rigid body is made of too many
particles but the distance
between any two particles is
always constant.
