The principal goals of the study were to articulate the scientific rationale and objectives of the field and then to take a long-term strategic view of U.S. nuclear science in the global context for setting future directions for the field. *Nuclear Physics: Exploring the Heart of Matter* provides a long-term assessment of an outlook for nuclear physics. The first phase of the report articulates the scientific rationale and objectives of the field, while the second phase provides a global context for the field and its long-term priorities and proposes a framework for progress through 2020 and beyond. In the second phase of the study, also developing a framework for progress through 2020 and beyond, the committee carefully considered the balance between universities and government facilities in terms of research and workforce development and the role of international collaborations in leveraging future investments. Nuclear physics today is a diverse field, encompassing research that spans dimensions from a tiny fraction of the volume of the individual particles (neutrons and protons) in the atomic nucleus to the enormous scales of astrophysical objects in the cosmos. *Nuclear Physics: Exploring the Heart of Matter* explains the research objectives, which include the desire not only to better understand the nature of matter interacting at the nuclear level, but also to describe the state of the universe that existed at the big bang. This report explains how the universe

---

can now be studied in the most advanced colliding-beam accelerators, where strong forces are the dominant interactions, as well as the nature of neutrinos.

This unique collection shows what happens when one university takes on the challenge of developing the scholarship of teaching and learning with a view to enhancing students' learning experiences. Authors from the sciences, engineering, humanities and social sciences, and from the health sciences, demonstrate the research they have done to investigate their students' learning. The editors, Angela Brew and Judyth Sachs, have captured the intricacies of teaching and learning in different academic domains in this rich and varied collection. The book explores students' responses to contemporary art, to multicultural music and to architecture for the poor and dispossessed. It explores students' ability to transfer mathematical knowledge from one subject to another; how students learn to talk like a pharmacist, or understand basic concepts in physics; how students are prepared for university study in first year classes or in the operating theatre; how they learn to write like a

---

scientist; how they learn in online discussions and how they understand group work and group assessment. Each chapter is grounded in rigorous research and scholarship and indicates actions that have been taken to improve teaching and students' learning. This book is a remarkable demonstration of scholarly teaching practice from a single institution. It should be read by all teachers and managers in higher and tertiary education institutions interested in developing teaching and learning.

During the past two or three decades, research in cognitive science and psychology has yielded an improved understanding of the fundamental psychological nature of knowledge and cognitive skills that psychological testing attempts to measure. These theories have reached sufficient maturity, making it reasonable to look upon them to provide a sound theoretical foundation for assessment, particularly for the content of assessments. This fact, combined with much discontentedness over current testing practices, has inspired efforts to bring testing and cognitive theory together to create a new theoretical framework for psychological testing -- a framework developed for diagnosing learners' differences rather than for ranking learners based on their differences. This volume presents some initial accomplishments in the effort to bring testing and cognitive theory together. Contributors originate from

both of the relevant research communities -- cognitive research and psychometric theory. Some represent collaborations between representatives of the two communities; others are efforts to reach out in the direction of the other community. Taking fundamentally different forms, psychometric test theory assumes that knowledge can be represented in terms of one or at most a few dimensions, whereas modern cognitive theory typically represents knowledge in networks -- either networks of conceptual relationships or the transition networks of production systems. Cognitively diagnostic assessment is a new enterprise and it is evident that many challenging problems remain to be addressed. Still, it is already possible to develop highly productive interactions between assessment and instruction in both automated tutoring systems and more conventional classrooms. The editors hope that the chapters presented here show how the reform of assessment can take a rigorous path.
