Schwab argues that this revolution is different in scale, scope and complexity from any that have come before. Characterized by a range of new technologies that are fusing the physical, digital and biological worlds, the developments are affecting all disciplines, economies, industries and governments, and even challenging ideas about what it means to be human. Artificial intelligence is already all around us, from supercomputers, drones and virtual assistants to 3D printing, DNA sequencing, smart thermostats, wearable sensors and microchips smaller than a grain of sand. But this is just the beginning: nanomaterials 200 times stronger than steel and a million times thinner than a strand of hair and the first transplant of a 3D printed liver are already in development. Imagine "smart factories" in which global systems of manufacturing are coordinated virtually, or implantable mobile phones made of biosynthetic materials. The fourth industrial revolution, says Schwab, is more significant, and its ramifications more profound, than in any prior period

of human history. He outlines the key technologies driving this revolution and discusses the major impacts expected on government, business, civil society and individuals. Schwab also offers bold ideas on how to harness these changes and shape a better future—one in which technology empowers people rather than replaces them; progress serves society rather than disrupts it; and in which innovators respect moral and ethical boundaries rather than cross them. We all have the opportunity to contribute to developing new frameworks that advance progress.

 Some pundits claim cyber weaponry is the most important military innovation in decades, a transformative new technology that promises a paralyzing first-strike advantage difficult for opponents to deter. Yet, what is cyber strategy? How do actors use cyber capabilities to achieve a position of advantage against rival states? This book examines the emerging art of cyber strategy and its integration as part of a larger approach to coercion by states in the international system between 2000 and 2014. To this end, the book establishes a theoretical framework in the coercion literature for evaluating the efficacy of cyber operations. Cyber coercion represents the use of manipulation, denial, and punishment strategies in the digital frontier to achieve some strategic end. As a contemporary form of covert action and political warfare, cyber operations rarely produce concessions and tend to achieve only limited, signaling objectives. When cyber operations do produce concessions between rival states, they tend to be part of a larger integrated coercive strategy that combines network intrusions with other traditional forms of statecraft such as military threats, economic sanctions, and diplomacy. The books finds that cyber operations rarely produce concessions in

isolation. They are additive instruments that complement traditional statecraft and coercive diplomacy. The book combines an analysis of cyber exchanges between rival states and broader event data on political, military, and economic interactions with case studies on the leading cyber powers: Russia, China, and the United States. The authors investigate cyber strategies in their integrated and isolated contexts, demonstrating that they are useful for maximizing informational asymmetries and disruptions, and thus are important, but limited coercive tools. This empirical foundation allows the authors to explore how leading actors employ cyber strategy and the implications for international relations in the 21st century. While most military plans involving cyber attributes remain highly classified, the authors piece together strategies based on observations of attacks over time and through the policy discussion in unclassified space. The result will be the first broad evaluation of the efficacy of various strategic options in a digital world.

This IBM® Redpaper™ publication describes the adapter-based virtualization capabilities that are being deployed in high-end IBM POWER7+™ processor-based servers. Peripheral Component Interconnect Express (PCIe) single root I/O virtualization (SR-IOV) is a virtualization technology on IBM Power Systems servers. SR-IOV allows multiple logical partitions (LPARs) to share a PCIe adapter with little or no run time involvement of a hypervisor or other virtualization intermediary. SR-IOV does not replace the existing virtualization capabilities that are offered as part of the IBM PowerVM® offerings. Rather, SR-IOV compliments them with additional capabilities. This paper describes many aspects of the SR-IOV technology, including: A comparison of SR-IOV with standard virtualization technology Overall benefits of SR-IOV Architectural overview of SR-IOV Planning requirements SR-IOV deployment models that use standard I/O virtualization Configuring the adapter for dedicated or shared modes Tips for maintaining and troubleshooting your system Scenarios for configuring your system This paper is directed to clients, IBM Business Partners, and system administrators who are involved with planning, deploying, configuring, and maintaining key virtualization technologies.
