When most altitude climbers reach their mid-forties, they slow down—but for Bob Villarreal, these years marked the beginning of his climbing career rather than the end. At forty, he took a rock-climbing class, but it wasn't what he was looking for. In a moment of pure and life-changing serendipity, an article about climbing the Andes lit a new fire within him, and an obsession was born. At that point, Bob retired from business and took up mountain climbing. He lost his heart to the staggering, raw, and wild beauty of the High Andes, returning there time and time again to challenge himself, almost always on his own. In defiance of the basic rules of wilderness exploration, Bob traveled solo, well aware that calamity was only one loose rock away and that his survival was never guaranteed. One might wonder why anyone — especially someone in middle age -- would climb alone in the Andes even once, let alone nineteen times (out of thirty total climbs). It's a question that Villarreal himself can't adequately answer. Was he in search of adventure, danger, or deeper meaning in his life—and did he ever find his elusive purpose on the mountain? This memoir recalls his perilous adventures on famous Andean peaks as well as mountains in the remotest parts of the Andes along the lengthy border between Chile and Argentina.

This book traces the history and development of a mutual organization in the financial sector

called SWIFT, the Society for Worldwide Interbank Financial Telecommunication. Over the last forty years, SWIFT has served the financial services sector as proprietary communications platform, provider of products and services, standards developer, and conference organizer ("Sibos"). Founded to create efficiencies by replacing telegram and telex (or 'wires') for international payments, SWIFT now forms a core part of the financial services infrastructure. It is widely regarded as the most secure trusted third party network in the world serving 212 countries and over 10,000 banking organizations, securities institutions and corporate customers. Through every phase of its development, SWIFT has maintained the status of industry cooperative thus presenting an opportunity to study broader themes of globalization and governance in the financial services sector. In this book the authors focus on how the design and current state of SWIFT was influenced by its historical origins, presenting a comprehensive account in a succinct form which provides an informative guide to the history, structure, activities and future challenges of this key international organization. This work will be of great interest to students and scholars in a wide range of fields including IPE, comparative political economy, international economics, business studies and business history.

Since their discovery was first announced in 1973, gamma-ray bursts (GRBs) have been among the most fascination objects in the universe.

While the initial mystery has gone, the fascination continues, sustained by the close connection linking GRBs with some of the most fundamental topics in modern astrophysics and cosmology. Both authors have been active in GRB observations for over two decades and have produced an outstanding account on both the history and the perspectives of GRB research.

This publication reviews most of the available literature on the fatigue properties of annealed Ti-6Al-4V and titanium alloys with similar microstructures. The focus is on processed and heat-treated alloys because annealed Ti-6Al-4V has been selected for highly loaded and fatigue-critical structures, including the main wing-carry-through bulkheads and vertical tail stubs, of advanced high-performance military aircraft. An important aspect of the review is a concise survey of fatigue life assessment methods and the required types of fatigue data. This survey provides the background to recommendations for further research, especially on the fatigue behaviour of annealed Ti-6Al-4V under realistic fatigue load histories, including the essential topic of short/small fatigue crack growth. Such research is required for independent fatigue life assessments that conform to the aircraft manufacturer's design requirements, and also for life reassessments that most probably will have to be made during the service life of the aircraft.
