A Chemical Engineer in the Palm Oil Milling Industry McGraw-Hill Companies

The majority of professors have never had a formal course in education, and the most common method for learning how to teach is on-the-job training. This represents a challenge for disciplines with ever more complex subject matter, and a lost opportunity when new active learning approaches to education are yielding dramatic improvements in student learning and retention. This book aims to cover all aspects of teaching engineering and other technical subjects. It presents both practical matters and educational theories in a format useful for both new and experienced teachers. It is organized to start with specific, practical teaching applications and then leads to psychological and educational theories. The "practical orientation" section explains how to develop objectives and then use them to enhance student learning, and the "theoretical orientation" section discusses the theoretical basis for learning/teaching and its impact on students. Written mainly for PhD students and professors in all areas of engineering, the book may be used as a text for graduate-level classes and professional workshops or by professionals who wish to read it on their own. Although the focus is engineering education, most of this book will be useful to teachers in other disciplines. Teaching is a complex human activity, so it is impossible to develop a formula that guarantees it will be excellent. However, the methods in this book will help all professors become good teachers while spending less time preparing for the classroom. This is a new edition of the well-received volume published by McGraw-Hill in 1993. It includes an entirely revised section on the Accreditation Board for Engineering and Technology (ABET) and new sections on the characteristics of great teachers, different active learning methods, the application of technology in the classroom (from clickers to intelligent tutorial systems), and how people learn.

Palm oil is a big business. Palm oil has been widely used in food and non-food industries. More than half the products on sale in supermarkets are made with palm oil—yet many people hardly know anything about this industry. They don't even know chemical engineers have a significant role to play in this industry. This book provides a series of episodes for you to discover the opportunities chemical engineers have in the palm oil milling industry. This book is an illuminating memoir that brings readers closer to the most enigmatic profession of all time. It is a promise that Hong Wai Onn has fulfilled again and again. More people have gained a better understanding of the role of chemical engineers in the palm oil milling industry by listening to his sharing. You do not have to be a chemical engineer or work in this industry to enjoy his memoir. The insights are just as valuable for any discipline of engineering, and for any business, for the sake of inspiration.
