Chemical Solution Deposition Of Semiconductor

It was not commonly used in

semiconductor processing for many years, but has seen a resurgence with more widespread use of chemical-mechanical polishing techniques. Chemical solution deposition (CSD) or chemical bath deposition (CBD) uses a liquid precursor, usually a solution of organometallic powders dissolved in an organic solvent. This is a ...

The chemical solution deposition (CSD) process is a wet-chemical process that is employed to fabricate a wide variety of amorphous and crystalline oxide thin films. This chapter describes the typical steps in a CSD process and their influence on the final microstructure and properties of films, and provides an overview of the different types of CSD processes.

6.5.4.3.2 Chemical Solution Deposition. CSD is a very versatile method as it provides excellent stoichiometry control and coverage of large surface areas. The application procedures used for CSD are quite similar to what is used in the semiconductor industry for application of

photoresist, which is a proven high throughput process.

Chemical vapor deposition (CVD) is a vacuum deposition method used to produce high quality, high-performance, solid materials. The process is often used in the semiconductor industry to produce thin films.. In typical CVD, the wafer (substrate) is exposed to one or more volatile precursors,

which react and/or decompose on the substrate surface to produce the desired deposit.
