Chemical Solution Deposition Of Semiconductor

Chemical Deposition Chemical Deposition is the precipitation of a metal salt dissolved in a chemical solution. The metal salt is then combined with another metal while in the solution. One common use of chemical deposition in metal finishing is in the semiconductor industry.

The chemical solution deposition (CSD) process is a wet-chemical process that has been used to design a wide variety of amorphous and crystalline oxide thin films. Compared to vapour and plasma processes, the thermodynamic driving force for the formation and crystallization of a solid phase from liquid-based solutions is much smaller.

It was not commonly used in semiconductor processing for many years, but has seen a resurgence with more widespread use of chemical-mechanical polishing techniques. Chemical solution deposition (CSD) or chemical bath deposition (CBD) uses a liquid precursor, usually a solution of organometallic powders dissolved in an organic solvent. This is a relatively inexpensive, simple thin-film process that produces stoichiometrically accurate crystalline phases.

To deposit layers of silicon nitride or silicon oxynitride one has to use gases which contain all necessary components. The gases are decomposed via thermal energy. That's the principle of the chemical vapor phase deposition: CVD. The wafer surface doesn't react with the gases but serves as bottom layer.

The bath solution contained cadmium acetate dehydrate  $[\text{Cd}(\text{CH}_3\text{COO})_2 \cdot 2\text{H}_2\text{O}]$ , so-dium selenosulphate  $[\text{Na}_2\text{SeSO}_3]$  and thiourea  $[\text{CS}(\text{NH}_2)_2]$  were used as the sources of  $\text{Cd}^{2+}$ ,  $\text{Se}^{2-}$  and  $\text{S}^{2+}$ , respectively. Tartaric acid ( $\text{C}_4\text{H}_6\text{O}_6$ ) was used as a complexing agent. The pH of the solution was adjusted to 12 by drop-wise addition of ammonia.
