Thin film - Wikipedia

The chemical solution deposition (CSD) process is a wet-chemical process that has been used to design a wide variety of amorphous and crystalline oxide thin films. Compared to vapour and plasma processes, the thermodynamic driving force for the formation and crystallization of a solid phase from liquid-based solutions is much smaller.

The bath solution contained cadmium acetate dehydrate [Cd(CH₃COO)₂ · 2H₂O], sodium selenosulphate [Na₂SeSO₃] and thiourea [CS(NH₂)₂] were used as the sources of Cd²⁺, Se²⁻ and S²⁺, respectively. Tartaric acid (C₄H₆O₆) was used as a complexing agent. The pH of the solution was adjusted to 12 by drop-wise addition of ammonia.

Chemical vapor deposition (CVD) is a vacuum deposition method used to produce high quality, high-performance, solid materials. The process is often used in the semiconductor industry to produce thin films. Chemical Solution Deposition Of Semiconductor To deposit layers of silicon nitride or silicon oxynitride one has to use gases which contain all necessary components. The

gases are decomposed via thermal energy. That's the principle of the chemical vapor phase deposition: CVD. The wafer surface doesn't react with the gases but serves as bottom layer.

Supplying experimental res Chemical Solution Deposition - an overview | ScienceDirect ... It was not commonly used in semiconductor processing for many years, but has seen a resurgence with more widespread use of chemical-mechanical polishing techniques. Chemical solution deposition (CSD) or chemical bath deposition (CBD) uses a liquid precursor, usually a solution of organometallic powders dissolved in an organic solvent. This is a relatively inexpensive, simple thin-film process that produces stoichiometrically accurate crystalline phases.
