VERBAI ReAcTiONS are a new form of word scrambles with a chemical flavor. You don't need to know any science to be able to solve VERBAI ReAcTiONS puzzles, but the puzzles bear a resemblance to chemical reactions. Here is a sample: Es + 2 S + P +

Si + 2 O + N --> _ _ _ _ _ .

This VERBAI ReAcTiON is a word scramble consisting of one Es, two S's, one P, one Si, two O's, and one N. That is, the word scramble contains the elements Es, S, S, P, Si, O, O, and N. Unscramble these elements to form an 8-symbol word (that's why there are 8 blanks in the puzzle). For this puzzle, the answer is P O S S Es Si O N (possession). These VERBAI ReAcTiONS resemble chemical reactions in two ways. First, the scrambled elements appear added together on the left of the reaction with coefficients (like the number 2 in the puzzle above) telling you how many of each element the solution contains, and you fill in the result of the VERBAI ReAcTiON by rearranging the elements and writing them

on the blanks on the right side of the reaction. Secondly, all of the solutions are chemical words. A chemical word is a word that can be made using symbols from the periodic table. For example, the chemical word POSSEsSiON is made using the symbols for phosphorus (P), oxygen (O), sulfur (S), Einsteinium (Es), silicon (Si), and nitrogen (N). You don't need to be familiar with the periodic table to solve these problems; nor do you need to know any chemistry. You just need to be able to count and unscramble elements to make words. This 'Hard' volume consists of words with 7 to 8 symbols, which involves familiarity with common 8 to 14 letter words. Other 'Medium' and 'Easy' volumes consist of shorter words. A unique feature of this book

is that there is a Hints section at the back separate from the Answers section, for puzzlers who may be stuck and want to check just the first letter of the solution. MORE EXAMPLES: (1) S + Ni + Ge + U --> _ _ _ _ . (2) 2 C + N + 2 I + P --> _ _ _ _ _ . (3) Ti + C + Cr + P + Y --> _ _ _ _ _ . (4) 2 C + U + 2 S + Es --> _ _ _ _ _ . You can find the answers at the end of this paragraph. Note that this hard volume consists of chemical words with 7 to 8 symbols, which are longer than the examples shown here. We recommend starting with our easy or medium puzzles before tackling these hard puzzles (available in separate volumes). ANSWERS: (1) GeNiUS (2) PICNIC (3) CrYPTiC (4) SUCCEsS.

Chemical word scrambles are an exciting new form of word puzzles. You don't need to know any chemistry! These chemical word scrambles will appeal to all word puzzle lovers, whether or not they also enjoy science. Each word is composed of symbols from the periodic table, instead of letters; but you don't need to be familiar with the periodic table to solve the word scrambles. Here is an example: The words BRaIn PoWEr are composed of the following symbols for chemical elements: B for boron, Ra for radium, In for indium, Po for polonium, W for tungsten, and Er for erbium. In chemical word scrambles, the words have been scrambled by rearranging the symbols – not the letters. Symbols that have two letters – like He for helium and Nd for neodymium – can't be split or have their letters reordered. • • • This creates a significant distinction between ordinary word scrambles and chemical word scrambles. For example, the symbols Er, V, S, and Es may be combined to form the word

SErVEs, but not the word SEVErs because symbols would have to be split to form SEVErs. One neat difference between ordinary word scrambles and chemical word scrambles is that chemical word scrambles allow us to make use of a vocabulary of longer words without effectively increasing the difficulty of the puzzle. For example, the word VERBAI is a 6-letter word, but only a 4-symbol word. When trying to rearrange the symbols AI, Er, B, and V to form the word VERBAI, there are fewer permutations to consider compared to rearranging the 6 letters A, I, e, r, b, and v to form the word verbal. We saw this as an excellent opportunity to make word scramble puzzles that involve a vocabulary of longer words. • • • The level of difficulty of this Chemical Word Scrambles puzzle book is EASY to MEDIUM. This book includes words that have 4 to 6 symbols, and therefore 4 to 12 letters; most of the words have 5 to 9 letters. Each puzzle features a challenge word made by rearranging the first symbol of each word. A unique feature of this book is that there is a Hints

section at the back separate from the Answers section, for puzzlers who may be stuck and want to check just the first letter of the solution. • • • This travel-size book comes in a convenient size for traveling, and uses a different word list than the full-size books.

Seventy years ago, Erwin Schrodinger posed a simple, yet profound, question: 'What is life?'. How could the very existence of such

extraordinary chemical systems be understood? This problem has puzzled biologists and physical

scientists both before, and ever since. Living

things are hugely complex and have unique properties, such as self-maintenance and apparently purposeful behaviour which we do not see in inert matter. So how does chemistry give rise to biology? Did life begin with replicating molecules, and, if so, what could have led the first replicating molecules up such a path? Now, developments in the emerging field of 'systems chemistry' are unlocking the problem. Addy Pross shows how the different kind of stability that operates among replicating entities results in a tendency for certain chemical systems to become more complex and acquire the properties of life. Strikingly, he demonstrates that Darwinian evolution is the biological expression of a deeper and more fundamental chemical principle: the whole story from replicating molecules to complex life is one continuous coherent chemical process governed by a simple definable principle.

The gulf between biology and the physical sciences is finally becoming bridged.

VERBAI ReAcTiONS are a new form of word scrambles with a chemical flavor. You don't need to know any science to be able to solve VERBAI ReAcTiONS puzzles, but the puzzles bear a resemblance to chemical reactions. EXAMPLE:

Here is a sample: $\text{Es} + 2 \text{S} + \text{P} + \text{Si} + 2 \text{O} + \text{N} \rightarrow$

_____. This VERBAI

ReAcTiON is a word scramble consisting of one Es, two S's, one P, one Si, two O's, and one N.

That is, the word scramble contains the elements Es, S, S, P, Si, O, O, and N. Unscramble these

It is based on solid, proven concepts. By creating a foundation that is applicable to all science ("Oh yes, Hydrogen, I remember coloring it, part of water, it is also used as a fuel; I wonder how I could apply this to the vehicle engine I am studying...") and creating enjoyable memories associated with the elements science becomes accepted. These students will

be interested in chemistry, engineering and other technical areas and will understand why those are important because they have colored those elements and what those elements do in a non-threatening environment earlier in life.
