Gifted and talented students and any student interested in pursuing a science major in college needs a rigorous program to prepare them while they are still in high school. This book utilizes a format where the application of several disciplines—science, math, and language arts principles—are mandated. Each lab concludes with either an essay or a detailed analysis of what happened and why it happened. This format is based on the expectations of joining a university program or becoming an industrial science professional. The ideal student lab report would be written in a lab research notebook, and then the essay or final analysis is done on a word processor to allow for repeat editing and corrections. The research notebook has all graph pages, a title section, and a place for the students and their assistants to sign and witness that exercise. The basic mechanics of the lab report—title, purpose, procedure, diagrams, data table, math and calculations, observations, and graphs—are

handwritten into the book. The conclusion is done on a word processor (MS Word), which allows the instructor to guide the student in writing and editing a complete essay using the MLA format. When the final copy is completed, the essay is printed and inserted into the lab notebook for grading. At the end of the term, the student has all their labs in one place for future reference. These lab notebooks can be obtained for as little as \$ 3.00 per book. This is money well-spent. In our district, the Board of Education buys the books for each student. The BOE sees these books as expendable but necessary materials for all science and engineering instruction.

that focus on constructing knowledge about the conceptual basis of laboratory techniques, instead of simply learning techniques. By focusing on developing skills for designing experiments, solving problems, thinking critically, and selecting and applying appropriate techniques, the authors expose students to a realistic laboratory experience, typical of the practicing chemist. This new edition continues the proven three-phase learning cycle: exploration of chemical behaviors within the context of the problems posed; concept invention--the use of data and observations to construct accepted scientific knowledge about the concepts explored in the laboratory investigation; and, concept application--where students

apply their conceptual understanding of the investigation at hand by modifying or extending the experiments, and write a report that emphasizes conceptual relevance. These college and honors level inquiry-based experiments correlate well with the recommended experiments outlined by the Advanced Placement Chemistry Development Committee. Regents Exams and Answers: Chemistry--Physical Setting Revised Edition Walch Publishing

The laboratory portion of a chemistry class can be a concern for teachers with limited lab facilities. This includes teachers in private schools, public schools, charter schools, and home schools. This manual and the accompanying kit are an effort to help solve this problem. The laboratory exercises have been designed with three goals in mind: 1) educational challenge, 2) safety, and 3) convenience for the

laboratory portion of the course, are based on the microscale method. This approach to chemistry gives students a lab experience as good as or better than the traditional methods, but uses about 1/100th of the chemicals. The experiments are much safer and disposal much easier. The chemical solutions are pre-mixed and in dropping bottles that give constant drop size. This eliminates the need to mix solutions, greatly reduces spills, and reduces set-up time to a few minutes. Introduction Lab - Melting Points, Super Cooling 1. Empirical Formula 2.
