The U.S. Army played a key role in the formation and administration of the Manhattan Project, the World War II organization which produced the atomic bombs that not only contributed decisively to ending the war with Japan but also opened the way to a new atomic age. This volume describes how the wartime Army, already faced with the enormous responsibility of mobilizing, training, and deploying vast forces to fight a formidable enemy on far-flung fronts in Europe and the Pacific, responded to the additional task of organizing and administering what was to become the single largest technological project of its kind undertaken up to that time. To meet this challenge, the Army-drawing first upon the long-time experience and considerable resources of its Corps of Engineers-formed a new engineer organization, the Manhattan District, to take over from the Office of Scientific Research and Development administration of a program earlier established by American and refugee scientists to exploit the military potentialities of atomic energy. Eventually, however, the rapidly expanding project turned for support and services to a much broader spectrum of the Army, including the War Department, the Ordnance Department, the Signal, Medical, Military Police, and Women's Army Corps, the Military Intelligence Division of the War Department General Staff, and the Army Air Forces. These and other Army elements worked together in close collaboration with American industry and science to win what was believed to be a desperate race with Nazi Germany to be first in producing atomic weapons. For both soldiers and civilians this history of the Army's earlier experience in dealing successfully with the then novel problems of atomic science seems likely to offer some instructive parallels for finding appropriate answers to the

problems faced in today's ever more technologically complex world.

Scores of talented and dedicated people serve the forensic science community, performing vitally important work. However, they are often constrained by lack of adequate resources, sound policies, and national support. It is clear that change and advancements, both systematic and scientific, are needed in a number of forensic science disciplines to ensure the reliability of work, establish enforceable standards, and promote best practices with consistent application. Strengthening Forensic Science in the United States: A Path Forward provides a detailed plan for addressing these needs and suggests the creation of a new government entity, the National Institute of Forensic Science, to establish and enforce standards within the forensic science community. The benefits of improving and regulating the forensic science disciplines are clear: assisting law enforcement officials, enhancing homeland security, and reducing the risk of wrongful conviction and

exoneration. Strengthening Forensic Science in the United States gives a full account of what is needed to advance the forensic science disciplines, including upgrading of systems and organizational structures, better training, widespread adoption of uniform and enforceable best practices, and mandatory certification and accreditation programs. While this book provides an essential call-to-action for congress and policy makers, it also serves as a vital tool for law enforcement agencies, criminal prosecutors and attorneys, and forensic science educators.
