"The fourteenth edition continues a long tradition of providing a firm foundation in the concepts of chemical principles while instilling an appreciation of the important role chemistry plays in our daily lives. We believe that it is our responsibility to assist both instructors and students in their pursuit of this goal by presenting a broad range of chemical topics in a logical format. At all times, we strive to balance theory and application and to illustrate principles with applicable examples whenever possible" --

Is chemistry really so valuable that, as Theodore L. Brown (2011) and his colleagues continue to claim in the twelfth edition of their work in 2011, chemistry is "the central science" in connecting the physical sciences with the life and applied sciences? (WK 2011 & 2011; C. Reinhardt 2001) This crowning of chemistry, however, can be contrasted with an opposing view, as Michael Polanyi once questioned the centrality of chemistry, when he wrote that "[n]o inanimate object is ever fully determined by the laws of . . . chemistry," so other fields of study are just as important. (BQ 2011) Contrary to these conflicting views about chemistry (and other ones discussed in the book), chemistry, in relation to substances and their changes, is neither possible nor desirable to the extent that the respective ideologues on different sides would like us to believe. This challenge to the conflicting views about chemistry does not mean, however, that chemistry is useless, or that those fields of study related to chemistry like astronomy, physics, geology, mathematics, material science, biology, psychology, computer science, and so on should be ignored too. Of course, neither of these extreme views is reasonable. Instead, this book provides an alternative, better way of understanding the future of chemistry—especially in the dialectic context of substances and their changes—while learning from different approaches in literature but without favoring any one of them or integrating them, since they are not necessarily compatible with each other. This book offers a new theory (that is, the creational theory of chemistry) to go beyond the existing approaches to literature in an original way. If successful, this seminal project will fundamentally change the way that we think about chemistry, from the combined perspectives of the mind, nature, society, and culture, with enormous implications for the human future and what the author originally called its "post-human" fate.

Science, engineering, and technology permeate nearly every facet of modern life and hold the key to solving many of humanity's most pressing current and future challenges. The United States' position in the global economy is declining, in part because U.S. workers lack fundamental knowledge in these fields. To address the critical issues of U.S. competitiveness and to better prepare the workforce, A Framework for K-12 Science Education proposes a new approach to K-12 science education that will capture students' interest and provide them with the necessary foundational knowledge in the field. A Framework for K-12 Science Education outlines a broad set of expectations for students in science and engineering in grades K-12. These expectations will inform the development of new standards for K-12 science education and, subsequently, revisions to curriculum, instruction, assessment, and professional development for educators. This book identifies three dimensions that convey the core ideas and practices around which science and engineering education in these grades should be built. These three dimensions are: crosscutting concepts that unify the study of science through their common application across science and engineering; scientific and engineering practices; and disciplinary core ideas in the physical sciences, life sciences, and earth and space sciences and for engineering, technology, and the applications of science. The overarching goal is for all high school graduates to have sufficient knowledge of science and engineering to engage in public discussions on science-related issues, be careful consumers of scientific and technical information, and enter the careers of their choice. A Framework for K-12 Science Education is the first step in a process that can inform state-level decisions and achieve a research-grounded basis for improving science instruction and learning across the country. The book will guide standards developers, teachers, curriculum designers, assessment developers, state and district science administrators, and educators who teach science in informal environments.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.
