The Muncie 4-speeds, M20, M21, and M22 are some of the most popular manual transmissions ever made and continue to be incredibly popular. The Muncie was the top high-performance manual transmission GM offered in its muscle cars of the 60s and early 70s. It was installed in the Camaro, Chevelle, Buick GS, Pontiac GTO, Olds Cutlass, and many other classic cars. Many owners want to retain the original transmission in their classic cars to maintain its value. Transmission expert and veteran author Paul Cangialosi has created an indispensable reference to Muncie 4-speeds that guides you through each crucial stage of the rebuild process. Comprehensive ID information is provided, so you can positively identify the cases, shafts, and related parts. It discusses available models, parts options, and gearbox cases. Most important, it shows how to completely disassemble the gearbox, identify wear and damage, select the best parts, and complete the rebuild. It also explains how to choose the ideal gear ratio for a particular application. Various high-performance and racing setups are also shown, including essential modifications, gun drilling the shafts, cutting down the gears to remove weight, and achieving race-specific clearances. Muncie 4-speeds need rebuilding after many miles of service and extreme use. In addition, when a muscle car owner builds a high-performance engine that far exceeds stock horsepower, a stronger high-performance transmission must be built to accommodate this torque and horsepower increase. No other book goes into this much detail on the identification of the Muncie 4-speed, available parts, selection of gear ratios, and the rebuild process.

After more than six years of active fighting in the Far East and over two years of open war between Japan and the Anglo-Saxon powers, Japanese political warfare was still a factor largely unknown in the Western world. Overshadowed by the much nearer and more closely felt exertions of the Nazi propaganda machine, it came to be regarded as too remote to have any noticeable bearing on the general course of the war. In the months leading up to Pearl Harbour, Tokyo Radio, the official Domei News Agency and the Japanese press jointly conducted an efficient war of nerves which, for all its alleged clumsiness effectively deceived many in Britain and the USA. The attack on Pearl Harbour showed how Tokyo's political warfare achieved its object: the creation of a political smoke-screen. During the period of Japan's conquests in 1942 following Pearl Harbour, and before that in China, Japan's political warfare showed itself quite capable of producing useful results. The volume is divided into two parts: the first deals with machinery and methods and gives as full and detailed a survey of the various government organs directing and controlling political warfare, the structure of the Japanese press, the organisation of Japanese broadcasting, the functioning of censorship and the extent to which education, science, literature, the arts and the cinema are being employed for purposes of propaganda, both in the Japanese homeland and in the wider area of the conquered empire. The second part deals with the aims and policies of Japanese propaganda, and attempts to give an outline of the way in which the machinery is being operated. It includes an analysis of the main groups of standard slogans and catchphrases which recur everywhere in Japanese propaganda and a special chapter is devoted to the use made of religion for purposes of political warfare.

Ultra fine-grained metals can show exceptional ductility, known as superplasticity, during sheet forming. The higher ductility of superplastic metals makes it possible to form large and complex components in a single operation without joints or rivets. The result is less waste, lower weight and manufacturing costs, high precision and lack of residual stress associated with welding which makes components ideal for aerospace, automotive and other applications. Superplastic forming of advanced metallic materials summarises key recent research on this important process. Part one reviews types of superplastic metals, standards for superplastic forming, processes and equipment. Part two discusses ways of modelling superplastic forming processes whilst the final part of the book considers applications, including superplastic forming of titanium, aluminium and magnesium alloys. With its distinguished editor and international team of contributors, Superplastic forming of advanced metallic materials is a valuable reference for metallurgists and engineers in such sectors as aerospace and automotive engineering. Note: The Publishers wish to point out an error in the authorship of Chapter 3 which was originally listed as: G. Bernhart, Clément Ader Institute, France. The correct authorship is: G Bernhart, P.
