The two chromosomes in a

homologous pair are generally very similar to one another. They're the same size and shape, and have the same pattern of light and dark bands, as you can see in the human karyotype (image of the chromosomes) shown above. Bands appear when the chromosomes are stained with a dye, and the dark bands mark more compacted DNA (usually, with fewer genes), while the light ...

### **DNA Replication – Principles of Biology**

Genes are packaged in bundles called chromosomes. Humans have 23 pairs of chromosomes, resulting in 46 individual chromosomes. Of those pairs, one pair, the x and y chromosome, determines whether you are male or female, plus some other body characteristics. Females have an XX pair of

chromosomes while men have a pair of XY chromosomes.

## Section 12 – 2 Chromosomes and DNA Replication(pages 295 – 299)

Discovered in the mid 19th Century, chromosomes are bundles of tightly packed DNA located in the nucleus (in eukaryotic cells).In prokaryotes, however, the chromosome exists as a circular DNA (located in the cytoplasm in the nucleoid) that can also be found in the plasmids.In eukaryotic cells, also, chromosomes can be found outside the nucleus in such organelles as the mitochondria.
