The average 5-year survival rate following a diagnosis of chronic lymphocytic leukemia, or CLL, is between 50 and 80 percent, according to Healthline. Survival at the 10-year mark is around 34.8 percent for both CLL types. The prognosis of CLL is affected by several factors, notes Healthline. Advanced age, high blood levels of beta-2-microglobulin and deleted chromosomes 17 and 11 in the leukemic cells all contribute to a poor prognosis.
