This book presents the ideas and industrial concepts in compact heat exchanger technology that have been developed in the last 10 years or so. Historically, the development and application of compact heat exchangers and their surfaces has taken place in a piecemeal fashion in a number of rather

unrelated areas, principally those of the automotive and prime mover, aerospace, cryogenic and refrigeration sectors. Much detailed technology, familiar in one sector, progressed only slowly over the boundary into another sector. This compartmentalisation was a feature both of the user industries themselves, and also of the supplier, or manufacturing industries. These barriers are now breaking down, with valuable cross-fertilisation taking place. One of the industrial sectors that is waking up to the challenges of compact heat exchangers is that broadly defined as the process sector. If there is a bias in the book, it is towards this sector. Here, in many cases, the technical challenges are severe, since high pressures and temperatures are often involved, and working fluids can be corrosive, reactive or toxic. The opportunities, however, are correspondingly high, since compacts can offer

a combination of lower capital or installed cost, lower temperature differences (and hence running costs), and lower inventory. In some cases they give the opportunity for a radical re-think of the process design, by the introduction of process intensification (PI) concepts such as combining process elements in one unit. An example of this is reaction and heat exchange, which offers, among other advantages, significantly lower by-product production. To stimulate future research, the author includes coverage of hitherto neglected approaches, such as that of the Second Law (of Thermodynamics), pioneered by Bejan and co-workers. The justification for this is that there is increasing interest in life-cycle and sustainable approaches to industrial activity as a whole, often involving exergy (Second Law) analysis. Heat exchangers, being fundamental components of energy and process systems, are both

savers and spenders of exergy, according to interpretation.

"Bucket of Blood" is what a coal town was called when

bloodshed occurred to establish a worker's union. During the

1927-1928 strike in the western Pennsylvania coalfields,

Russellton became known as such a place. In an effort to

break the strike, special Coal and Iron Police were brought

into the area to evict the mine families from their company

houses. These men imposed

unconstitutional restrictions to

harass the people and keep out relief workers and organizers. It was a time of brutal beatings, rape, and murder. Without union representation, the workers were constantly exploited. Because the company used many weapons to keep them enslaved, the miners' families were forced to live in abject poverty. The miner had only one weapon, the strike. *Bucket of Blood: The Ragman's War* chronicles the deprivation and indignities suffered by the families in the Russellton camps during the strike. Author R.S. Sukle explores the glimmers of hope appearing through relief efforts by the sons of a local farmer who become union activists. Ragman, a mine mechanic, walks out with the other men. Against his intentions, he is drawn into the struggle by his brothers, and the abuse that is heaped on his family by the Coal and Iron Police. The killing of a state Coal and Iron Policeman in

Russellton is a local legend. The killer was never identified. This story has been passed down in certain families, each with their own version. Each claims the killer as a relative. *Bucket of Blood* is one of those stories.

The story of the Soviet Union's
cars has to be seen in the
context of a planned society in
which everything was planned
well in advance, and consumer
items were not a priority until
well after the Second World

War. This extraordinarily
detailed study charts the history
of Soviet cars from the birth of
the Soviet Union in 1917 until
its demise in 1990, with a
conclusion about the post-
Soviet era. It is the story of an
insular, state-run car industry in
which the carefully thought-out
ideas of ministerial planners,
rather than fickle customers in a
free market, determined what
cars were made in a country
where the open road was often a
300-mile track across a
windswept steppe.
