This critical addition to the growing literature on innovation contains extensive analyses of the institutional and spatial aspects of innovation. Written by leading scholars in the fields of economic geography, innovation studies, planning, and technology policy, the fourteen chapters cover conceptual and measurement issues in innovation and relevant technology policies. The contributors examine how different institutional factors facilitate or hamper the flows of information and knowledge within and across firms, regions, and nations. In particular, they provide insights into the roles of important institutions such as gender and culture which are often neglected in the innovation literature, and demonstrate the key role which geography plays in the innovation process. Institutions and policy measures which support entrepreneurship and cluster development are also discussed. The result is a comparative picture of the institutional factors

underlying innovation systems across the globe.

This book discusses the ways in which characteristics of innovative firms and innovative talents with core competence in Japanese, Korean, German, and American contexts are

developed and nurtured, and compares innovative firms with a long history of business operations from these four countries. Firstly, the book examines innovation practices of long-lived Japanese firms and compares them with those of German, American and Korean firms. Based on extensive interviews with executives and field studies, it identifies the essential qualities of each country in which these innovative firms and innovative talents are found. It then focuses on theoretical and practical aspects, using the theoretical framework to define organizational and technological factors for long-term innovation success. Further, the book provides recommendations based on organizational practices for developing innovative talents in Japanese, German, American and Korean contexts. Intended for academics, students and practitioners in the areas of organizational theory and strategic management, this book clarifies the critical practices of long-lived innovative firms and organizational innovators.

Electrical-engineering and electronic-engineering students have frequently to resolve and simplify quite complex circuits in order to understand them or to obtain numerical results and a sound knowledge of basic circuit theory is therefore essential. The author is very much in favour of tutorials and the solving of problems as a method of education. Experience shows that many engineering students encounter difficulties when they first apply their theoretical knowledge to practical problems. Over a period of about twenty years the author has collected a large number of problems on electric circuits while giving lectures to students attending the first two post-intermediate years of University engineering courses. The purpose of this book is to present these problems (a total of 365) together with many solutions (some problems, with answers, given at the end of each Chapter, are left as student exercises) in the hope that they will prove of value to other teachers and students. Solutions are separated from the problems so that they will not be

seen by accident. The answer is given at the end of each problem, however, for convenience. Parts of the book are based on the author's previous work Electrical Engineering Problems with Solutions which was published in 1954.
