Solved: I want to find out if you can do manual pruning on trunk links on downstream switches that are clients in my VTP domain, without enabling pruning on the VTP server? I have low end switches that have met the max STP instances and need to prune

I tried issuing the "no boot manual" command in Global Config mode but it did not change the variable according to a show boot command. According to Cisco documentation, the "no boot manual" command only works on standalone devices. Does anyone know of a way to change the variable while the switch is a member of a stack?

For example, Pruning makes sense if you have lots of IP Phones and you have configured each port on the switch as a trunk port to allow the data and voice vlan. Here manual pruning would work nicely in limiting broadcast/STP traffic on all these ports and thereby server as an important enhancement in your network health/performance.
